3156. Re: memory upgrade

Newsgroup: comp.sys.atari.st
Date: 1990-11-10 15:45:37 UTC
From: wolf@fb14vax.sbsvax.uucp
Message-ID: <WOLF.90Nov10164537@fb14vax.sbsvax.uucp>
Source record: 237376

In article <67996@bu.edu.bu.edu> selick@bucsf.bu.edu (Steven Selick) writes:

> What have people found to be the best way to upgrade a 1040st to 4 meg?

I'm also very interested in a comparison of the various memory upgrades.
Is it better to look for DRAMs, SIPs or SIMMs or whatever? Which method
is more reliable (soldered, pluged-in, ...)?
The number of ads in some magazines I read is more and more increasing -
and prices are sinking, will they become even cheaper in the (near) future?

As there's a discussion about ROM-based vs. disk-based TOS upgrades:
I would rather spend, say $250, to upgrade to 2.5 or 3 MB and then will
be able to use all the free TOS enhancements (loaded from hard disk) and
still have enough memory for applications than get a new ROM TOS, which
costs >$100 and nethertheless requires some more patches to be loaded from
disk.

Back to the original question: anyone any opinion/experience/advice about
RAM upgrades that he/she will pass to those poor 1M ST owners? :-)

Thank you in advance

Wolfgang

> multitasks GEM and TOS programs. If anyone has further info,
> especially a press release, I'd appreciate receiving a copy.
>

The last ST Report had a press release. The brief intro to the press release raved about how this went beyond RTX and MiNT by providing multitasking to GEM programs. Curiously, though, the press release itself says:

... "TOS" and "TTP" programs are a special case. Without SLICCDOS installed, queued processing is suspended while "TOS" and "TTP" programs are executing. With SLICCDOS installed, "TOS" and "TTP" programs run directly on the desktop in user sizable windows; and queued processing continues just as it would for any desktop application.

["Another product, SLICCDOS, which will be released in 4 to 5 months, will completely replace the file management system on the Atari." from earlier in the press release]

... Yes, now there is true multitasking on ATARI . . . and a system far superior to any other in the marketplace. But, that does not mean that your system is now capable of executing multiple Atari programs concurrently. Many of the developers who designed software for use on the Atari have designed it in such a way as to prevent efficient multitasking, and in some cases, even made their software totally incompatible with a multitasking system by use of what may be termed as system-hacking technology.
... To avoid the disasters of system crashes resulting from attempting to multitask conflicting hacker software, SLICCWARE has chosen to run the entire Atari operating system as though it were a single task. To further avoid problems, the major operating system functions such as disk access and window control are constantly monitored, even if the major portion of SLICCTOP has been swapped out at the user's request while an Atari program is executing. The result, the user may only run one Atari program at a time. He may, however, run that program while queued processing is taking place.

In other words, SLICCTOP doesn't multitask ANY Atari programs! What it does seem to provide are background file copies, disk formatting, and printing. Modules are promised to do other applications in the background; but the bottom line is that you have to buy these modules from SLICCWARE. You can't do a compile in the background and play a game in the foreground unless either the compiler or the game is written specifically for SLICCTOP.

This, of course, can be very useful; but it's hardly a new situation. RTX and MiNT both provide essentially the same facilities, with the added bonus of not requiring you to buy another product 4 or 5 months from now to multitask TOS and TTP programs.

Just rename the program files from the second mission to the same name as the
old mission. It loads fine. Both games use the same sound files and such...

> the Public Domain? - or does it simply cease to be available? - or ??

Copyrights last something like 27 years. Of course, the cynics among you will
point out that since the company has vanished, there's no one around who will
prosecute you for violating their rights. I think in the case of PC-Dittio it
will simply cease to be available.

>And sort-of related:

> (3) Is there a PD PC emulator? (PD-Ditto???)

Probably not. I have written an 8086 simulator, but you need a lot more than
that to emulate a PC. (You also need a lot more speed to make it worthwhile...)

>just take a couple of partitions (I have 115 MB of disk space now)
>and install Minix ST.

I set aside 50 meg of disk for Minix on my system, and I'm finding that it's at least 30 meg of wasted space. The applications I want to run have all been written for TOS, and it's a lot of effort to support both TOS and Minix simultaneously. I am probably going to trim the Minix stuff off sometime soon. (Maybe not entirely, but who knows. I haven't booted it up in months...)

>How many of you are using Minix? I know that there have been many
>improvements in the new version. Minix is supposed to be V7 compatible.
>Does that mean that -DBsd in a cc command line is enough to compile
>Unix code for Minix? Is job control possible? Is this a stupid idea?
>I'd hate to have to shell out $200 (Canadian, approximately) for Minix,
>but I guess it's really quite cheap.

BSD is several generations beyond plain 7th Edition Unix. ST Minix is a pretty good clone of V7, but not enough to make things that easy. Both BSD and SysV Unix are derived from V7, but generally it seems to be easier to port SysV flavor programs to Minix. It takes a fair bit of editing, regardless. There are a lot of good ideas in Minix, but performance-wise I think TOS is still faster. I'm kind of torn between working on MiNT and RTX and adding new features to Minix, but I think since MiNT and RTX allow me to continue using things like Uniterm, I'm eventually going to give up on Minix.

3166. Gnu emacs and multitasking on the ST?

Newsgroup: comp.sys.atari.st
Date: 1990-11-11 01:37:53 UTC
From: jones@ils.nwu.edu
Message-ID: <2525@anaxagoras.ils.nwu.edu>
Source record: 237386

I would like to use an ST to run a more or less complete version of gnu emacs in a Unix-like environment with multi-tasking, (I hear that MiNT provides this kind of environment). However, I currently own only a basic 1040 ST and no hard disk, which is almost certainly insufficient to this task. Therefore, I'm considering replacing my ST with an STe with 2 or 4 megabytes of memory and a hard disk. However, I am not sure that all of my information is correct. Some questions:

** Is gnu emacs in fact available for the ST? The full distribution, or some restricted subset of it?
** Is any additional software needed to run it, e.g. Minix? To build it? Does gnu emacs run under MiNT?
** How much main memory is needed?
** How much disk space does the distribution take up?
** Does it run acceptably fast? (A related question: What are the CPU specs for the STe?)

On another front, I have some questions about price:
** What is fair market price for my old 1040 ST, (mono, 1 meg, single floppy drive)?
** What is a reasonable price for an STe, used, mono, with a hard disk and 2 or 4 meg of memory?

I would greatly appreciate answers to any of these questions. Please reply by email to jones@ils.nwu.edu .

Thanks,

Eric Jones.

Actually, the 'priority tasking' erally doesn't mean too much to the real world GEM/TOS user. It boils down to that you can do desktop functions enmasse and simultaneously, and even when you are in a program (supposedly), but you can only run one GEM app, and you can't even multitask TOS programs, because it isn't a TOS multitasker like MicroRTX or MiNT.

To get any special GEM multitasking, you'd have to right for his specific library calls.

Don't get me wrong, he has spent a _great_ deal of time working on it, but I fear it is too late to be accepted as the multitasking answer...

3178. Re: Are there any original screen blankers out there?

Newsgroup: comp.sys.atari.st
Date: 1990-11-12 09:59:36 UTC
From: jeroen@pluto.phil.ruu.nl
Message-ID: <930@accucx.cc.ruu.nl>
Source record: 237398

Has anyone ever seen After Dark for the Macintosh? It's a screen blanker with all the features, it's modular, so you can add your own favourite gimmick... and on my Mac IIci the program, even without all the modules available, takes up some 600 kB of disk space. Does this sound like a screen saver you'll want to use on a daily basis? Nope.

I'm glad on the ST there still are screen savers that only use 120 bytes of memory, that don't need half your hard disk, that don't waste 20% of your computer time...

I now, it's me, I have a bug about these things... I'd like programmers to spend
their precious time on other (useful?) things; there's lots and lots of work to be done yet out there of a higher priority, I think.

Let's not quarrel over screen savers when even the ultimate word processor is not available.

3179. TT Tos disk available in France...

Newsgroup: comp.sys.atari.st

I think it's just like publishing your Fax -number and receiving
illegal advertising. You don't have to pay the sender's phone bill,
but your own fax paper. This is one of the reasons why advertising
via Fax is illegal.

>inside a LOUD signature which everyone would skip. Put it at the

From: isodonovan@npe.isnet.inmos.co.uk
Message-ID: <122.273e87f0@npe.isnet.inmos.co.uk>
Source record: 237400

Silly question time (maybe).

If the company responsible for PcDitto][no longer exists, what happens to
the copyright, availability etc?

A friend of mine was wondering if the s/w inevitavbly becomes Public Domain
(PDditto?) but I tend to think that this is unlikely...!

Any thoughts, anyone?

Thanks

Brian

3182. Atari Jaguar

Newsgroup: comp.sys.atari.st
Date: 1990-11-12 11:37:46 UTC
From: dh@tardis.cs.ed.ac.uk
Message-ID: <sent.Mon.Nov.12.11
Source record: 237301

I'm hoping (!!) for a reply from someone from Atari about this...but I realise they probably won't reply.

What I want is some more info about this new Atari Jaguar machine that I've been hearing about. It's supposedly going to cost 700 UK pounds and be based on a 68020 running at 16MHz.

I've heard it's basically a cut-down TT.

It's only a very big rumour..but can Atari shed any light on it?

Your Hopefully
Richard

3183. Gemini v1.2

>Matthew

I would have thought that people would have been all over you to
tell you that this is impossible.
The XBIOS call Setscreen() will change the resolution alright, but
it will not tell the AES to change the resolution. The AES and VDI need to
know that the resolution is being changed, and in current TOS versions, the
only time this kind of stuff is initialised is during boot-up.
I thought of automating the desktop features via hotkeys too, but
I quickly realized that this isn't something that mere mortals were meant
to do.
This what I know about GEM. If what I said isn't true, please
don't hesitate to correct me.

3189. floating point package for GCC

Newsgroup: comp.sys.atari.st
Date: 1990-11-12 16:52:34 UTC
From: tasayco@phoenix.Princeton.EDU
Message-ID: <4007@idunno.Princeton.EDU>
Source record: 237309
Cross-posted to: comp.os.minix,comp.sys.atari.st

Hi! I know people in these groups is not very numerically-oriented, but maybe somebody is interested.

After having had many problems with the floating point routines which came with the GNU C compiler (I am using version 1.37.1), like, for example, the comparison between single floats being broken, the printing routines given too many digits, etc, I decided to write my own routines and try to support the IEEE standard. At the moment I have written the arithmetical (add, sub, mul, div, neg and cmp) routines for both single and double floats, with full support of denormalized numbers and infinity. They can be used as they are to replace the GCC routines (just pull out the corresponding routines from the library and install mine). I have been testing them and they seem to be OK, but I would appreciate other people's tests. Things I haven't yet done, but will in the near future: conversion routines (from single to double and back, and to int and back), a new printing routine which works, exception handling (maybe I will implement this in Minix, inside the kernel), support for different rounding modes (the hooks are there, though). I also haven't made extensive speed tests, although the single float routines I think are a little bit faster than the GCC ones (and they support denormalized and infinities, which the other do not!), and the double will probably be also, since I wrote them in assembler (yes, I am a bit crazy) instead of in C.

If somebody is interested please send me mail, since I don't want to use bandwith unnecessarily. If I see that there is enough interest I will post them to the net, though.

Hi Ray,
I've tried e-mailing you before with other replies but I keep getting
bounced mail. Not sure why. Anyway...
I have MacPrint, and yes it is a very good software package, but it
does not support Epson printers. It only handles HP-PCL printers.

Can someone who is using this post some data transfer times (hopefully in megabytes/minute, though I realize accuracy will be poor if the program doesn't calculate this for you)...

I have Beckmeyer's backup software, and it isn't bad, but there aren't many frills (incremental backups must have fresh disks, partial restores are difficult, no index of files is kept in text-readable format). Does BackupST do any of these?

3194. AES Support

Newsgroup: comp.sys.atari.st
Date: 1990-11-12 18:52:37 UTC
From: jimomura@lsuc.on.ca
Message-ID: <1990Nov12.185237.8817@lsuc.on.ca>
Source record: 237314

Having successfully added the graphic display I wanted
in the program I'm working on, I decided to try to add
some mouse support. Again I faced the question of deciding
the level to work on. In this case the decision was again
simple, but the opposite of my earlier Line-A approach. My
documentation of the low level mouse call is very sketchy
and not sufficient to program with. So I decided to finally
give a try at programming on the AES level.

I have the "Compute!'s Technical Reference Guide
Atari ST Vol. 2" by Sheldon Leemon and it looked fairly
complete, so having read all that I expected I'd needed, I
started into the programming. The first thing I found was
that the Sozobon C 1.2 DLIBS library didn't have any bindings
for "appl_int()" and "appl_exit()". So I couldn't even
get started. Nor was there a "GEMDEFS.H" file, which
didn't bode well. So I checked the libraries as best as
I could and came to the conclusion that GEM AES calls are
simply not supported by Sozobon C. I looked again at the
Leeman book and I'm not sure yet if there really is enough
information for me to build the support functions.

If anybody has sources for support functions, again,
I'd appreciate it. If not, well, I'm going to start in
coding my own for now. And that leads me to my most
immediate problem. I've coded what I think are valid
implimentations for an 'appl_init()' equivalent function
and an 'appl_exit()' equivalent function. These are
deliberately a bit different then the functions described
as being "standard". In the "standard" versions, the
AES Base Pointer Structure is a global that is presumed
by the function calls and thus, *no* arguments are passed.
In my versions I pass a pointer to the structure. I won't
go into why I wrote it this way. I'll simply say that it's
my personal opinion that this is probably a better idea.

But having written the functions, and a test program,
I ran it and found that the 'ap_id' returned is always 0.
This doesn't sound right to me, though it could be. Does
anybody know if this is a reasonably possible result?
The following is my source:

3195. Atari earnings

Newsgroup: comp.sys.atari.st
Date: 1990-11-12 19:38:12 UTC
From: saj@chinet.chi.il.us
Message-ID: <1990Nov12.193812.268@chinet.chi.il.us>
Source record: 237315

Atari reported net earnings of 5 cents a share for the most recent quarter. From the brief summary in the Wall Street Journal, the quality of the earnings looked a bit questionable, but the trend of improvement seems clear. This is not too surprising, given that in this quarter a year ago Atari had hardly any product to sell.

The only significance of this to ST users is that as long as the earnings stay positive, Atari isn't about to be forced out of business.

Steve J.

I don't understand the problem. Why will the AES and VDI need
to be reinitialized in the other resolution and more than that, why
can't you just 'appl_exit()' and then 'appl_init()' again if it's
necessary? I've just finished adding a resolution change in a
program to do graphics and I wrote information to the screen without
problems, so that much seems to work ok. As for the mouse routines,
I don't know how they'll react. I haven't gotten that far yet.
Is it the windowing subroutines that'll muck up?

Cheers! -- Jim O.

This is NOT an advertizement. A couple of months ago I posted a phone number where people could call to order Quick ST by phone. This phone number was the number of Xanth Computers, a local Seattle computer dealer that came to me and offered to handle my phone and credit card sales. They apparently have been mailing out orders as promised, but I have started receiving email from people that have been waiting several weeks for their orders. When they phone Xanth they are told by one of the salesmen that they cannot ship anything because they are waiting for me to restock them. I am at Xanth everyday to check on their supply, and when I checked a few days ago they had several copies of Quick ST on the shelf. I have also been trying to get paid for all these orders. Their excuse for the last 3 weeks has been that they have had bills to pay and don't have the money. Their store is pretty empty almost all of the time. If I do not get my check this week, I am taking them to small claims court to salvage what I can. My suspicion is that Xanth is yet another Atari ST dealer about to go belly up, and they came to me to make some quick cash to pay their bills. They now owe me several thousand dollars, which they do not seem to want to give to me. I am no longer stocking them with any product, and am posting this message to all the boards and services to warn people to not do any business with them. Phone orders, or walk ins. Do not call (206)-643-9697 to order _anything_. I recommend placing orders with a large mail order dealer such as Joppa or BRE Software.

I called them and they said the November issue is running a bit late. Funny, I just saw it in the local computer store, but I, a subscriber (for three years!) still don't have it. I dunno, seems like you hafta pull teeth from these people to get anything lately... hopefully all the confusion from the "reverse expansion" will die down soon.

I'm turning my ST into a Mac with Spectre GCR anyway, so I'm just gonna let my subscription expire when it runs out. The ST is a dying machine... too bad, considering how good it is price/performance wise.

Message-ID: <1154@ssp18.idca.tds.philips.nl>
Source record: 237327

Hi,

Last month my original Atari mouse died (after three years intensive use),
and I have to replace it.
Is it possible to connect a MicroSoft mouse? What additional hardware
(and software ?) do I need?
I own a 1040ST / TOS 1.4.
If it is not possible, what would be a good replacement for the Atari mouse?

Thanks in advance.

Source record: 237328

Waouuuuu. I receive in one night more than twenty questions about
TT TOS on disk... Read carefully:

1) this TT TOS (this is the official name) is one file which is about
290 KBytes long. The name of the file is NEWDESK.PRG

2) this TT TOS a ST-disk-version of the TOS I saw running on a TT.

3) I don't think this version is free of distribution. Maybe it has been
distributed free of charge to *some* developpers in France because the
TT computer is only available since some DAYS in France... One of them
did not keep it secret !!!

4) there is one file called TOS20.ARC available on the finnish ftp site :

jyu.fi

this file is in the directory /pub/atari.

-rw-r--r-- 1 548 mat 99459 Oct 21 21:33 TOS20.ARC

I don't know what it is ... Try !

5) I cannot send my version to the net because
* it is in France and I'm now in Sweden
* I cannot access comp.sys.atari.st in France

6) One thing is missing in my version : the TT Control Panel Acc with its CPX.
can someone send it to me ?

7) jk44+%andrew.cmu.edu@po10.andrew.cmu.edu wrote :

>> could it be sent to atari.archives?
>> I'm sure the entire (U.S.) Atari community would be eternally grateful.

I know, but read 5)... If you send me a e_mail with your **postal** address,
I will send you a copy when I will be back in France (end of December)

/Enjoy/ Daniel.

Sozobon C does not contain GEM support. There -are- GEM Bindings and support libraries (for AES/VDI), written by Ian Lappore. You should check the archives for the GEMFAST archives (atari.archive.umich.edu has the version 1.2 bindings in "/atari/Binaries/volume05/gemfst12.arc" -- meaning they were posted to comp.binaries.atari.st at one time.

The latest version is 1.3 or 1.4. I didn't see them in the 'programming' subdirectory. Good luck.

3211. undump and dvieps

Newsgroup: comp.sys.atari.st
Date: 1990-11-13 13:28:52 UTC
From: uttwkt@utrcu1.UUCP
Message-ID: <726@utrcu1.UUCP>
Source record: 237331

I have three questions.
1) I am trying to generate a new version of LaTeX.ttp with dutch hyphenationrules. To achieve this, I use the program "undump" from the mail-server in Utrecht. However, this program aborts almost immediatly, after an errormessage like "virtex.ttp: can't load". As far as I know, I entered all pathnames correctly. Has someone an idea how to solve this?

2) I am using "dvieps" to print TeX-output on my Epson-printer. This program quickly gives the errormessage "readfont: not enough memory to read fonts". Is there a way to increase the amount of memory it uses?

3) There is a program called "dvie72", which prints TeX-output on an Epson-printer in draft-mode. The printing, however, is far to wide on my printer. Is there a solution to this problem, or a correct working program that does the same?

If anyone can answer one (or more) of these questions, please mail me at "hvdberg@math.utwente.nl" or at "uttwkt@utrcu1.UUCP".

Thanks!!

ZCOMDEX1.TXT

Sunday Morning, November 11, 1990 - John Nagy

Setup continues at the ever-more massive COMDEX computer exposition
here in Las Vegas, Nevada. I visited the new show floor at the
Sands Convention facility on Saturday afternoon to see the Atari
exhibit being built. It is the largest floor area for a COMDEX that
I have seen Atari have yet, with a mixed color scheme that clearly
illustrated the differentiation of the Atari Personal/Home computer
products from the Atari Business products. The Home area is
accented by rainbow colored banners, rich in flourescent oranges,
while the Business area is a dignified Black and White.

Yes, the MEGA/STE is REAL, and I am writing this first report on
one! The configuration is as predicted weeks ago in Z*Net, identical
construction to the TT, although in Grey rather than off-White. A
pair of Serial ports are offered, as well as the local area network
(Appletalk compatible) port, although the LAN and Serial 2 appear to
share internal harware connections and cannot be used
simultaneously. There is no SCSI port on the Mega/STE as on the TT,

but all the other ports are the same. A VME bus cart slot is accessable through a panel on the back of the machine. Most of the MEGA/STE machines here have an additional serial port card installed there.

The Mega/STe will have a base unit featuring 2 MEG of RAM, a switchable 16/8 Mhz acceleration (yes, SPECTRUM compatible) with or without RAM cache, and an internal 40 megabyte hard drive, the new TT style TOS/Desktop (which shows on test programs to be calling itself TOS 2.2)... and will be available "after the first of the year" for a price that is to "knock out the Mac Classic". That may be UNDER $1200! All the Mega/STe units here on display are hooked to the new Phillips 15" color monitors, the STERO SOUND units, model SC1435. This is VERY nice, large screen unit that will replace the SC1224 monitors completely, and should retail at or just above the current color monitor price. It IS a step UP.

At least five Mega/STe units are set up in the Atari booth, along with more than seven TT/030 units. The TT's are running the new SC1434 color monitors that offer the new TT resolutions ($450), and at least two are on the new Phillips 19" monochrome monitors... VERRRRY impressive at under $1,000 each. The bad news is... no FCC number for the TT yet. This means NO promises on WHEN they can be shipped, despite the early assurances of "immediately after COMDEX."

In keeping with the business flavor of COMDEX, the "Home" part of the Atari booth is small... featuring twin setups of 1040STe units on modems for CompuServe and GEnie. Side by side. It looks like the ONLY computer that Atari considers as a HOME unit now is the 1040STe. It may, in fact, become availble to ALL dealers of any hardware or software if plans to place the 1040STe line with national distributors come to fruition.

Portfolios are all over the place, with hookups to a couple "alien" computers... a Mac SE and an IBM PS/2. It was a bit odd to see those computers in the Atari booth, but they are there to demonstrate connectivity with the palmtop Portfolio computer.

Developers are arriving to populate the wide isles of the Atari exhibit, and this COMDEX again promises lots to see... starting Monday. Z*Net will offer VIDI-ST pictures as we can convert them and get them online.

I expect to have additional COMDEX reports from Z*NET each day, with a complete wrapup in the next regular Z*NET issue on Friday, November 16. Don't miss it!

It is possible. I've got a flaky but usually working driver for a Genius mouse
in 3-button mode, but rewriting it for the MicroSoft mode is almost trivial.
I have not figured out how to make the driver more stable, though.

Source code in Turbo-C + assembler available on request.

The available replacement mice don't need addition software.

I think I heard here that the Konyo mouse is a Microsoft mouse
adapted for the ST. Otherwise, a lot of people like the Golden Image
mouse.

> superior to any other in the marketplace. But, that does not mean that

Before I go out and throw my Amiga into a great pond somewhere, could you possibly tell me why this multitasking system for the atari is "far superior to any other in the marketplace"?

If you meant this as a snide comment, then err, why did you bother?

Hello David!
I didn't use your implementation of Metafont, but the manual of my MF says that there are no great differences between INIMF and MF. You can't exchange the base-files between different implementations of MF. I would try to load the plain definitions with 'metafont plain.mf' after a little time MF should come with an asterisk as prompt. There you should give the command 'dump'. Now you will get a file which can be used as a new base-file.
That's the way I would try. I don't know if it will work ok for your MF.

Try it and tell me your results.

Greetings, Olaf

3223. Software for an ST Hard Drive???

Newsgroup: comp.sys.atari.st
Date: 1990-11-13 19:35:50 UTC
From: don@col.hp.com
Message-ID: <16830004@col.hp.com>
Source record: 237343

I'm setting up a hard drive for my sister to use with her ST for school stuff (specifically writing papers, and eventually her dissertation). What I'd like to know is what programs I should put in the auto folder, and what utilities I should provide to help her maintain her system. She is not really computer literate, and sees her ST strictly as a writing tool, but she does have some (limited) knowledge of the basic operations required to use the system.

Since she is running TOS 1.0 on a 1 meg ST, I assume I should include the 40 folder fixer program, and I suppose I should also include some sort of hard disk backup program, as long as it isn't too hard to run. What else? Any suggestions for other "necessary" utilities, "bug fix" programs, or speedup routines? Free/cheap is better since she isn't gung-ho about spending money on computer stuff, but as long as the benefit/cost ratio is high enough, she's willing to consider anything.

Basically, could people send me lists of what they have in their auto folders for TOS 1.0 machines, and what utilities they find indispensible? If there is enough interest, I'll summarize what I find out.

Thanks,
Don Allison
don@col.hp.com

I would just duplicate my setup, but 1) I am running hacked up hardware and TOS 1.4 with it's different set of problems, and 2) I'm also running a bunch of commercial stuff that I don't think she needs, and so am not excited about spending the money to buy another copy for her to give her features she'd never use.

3224. proff for the Atari

Newsgroup: comp.sys.atari.st
Date: 1990-11-13 20:31:46 UTC
From: swklassen@rose.uwaterloo.ca
Message-ID: <1990Nov13.203146.13063@watdragon.waterloo.edu>
Source record: 237344

Does proff exist for the ST?

I have just downloaded the 'progem' tutorial from atari.archive and
have discovered that they are written in a format no human can
understand. Of course none of the UNIX machines I have access
to seem to have proff.

Could someone please e-mail me an Atari version of proff or point
me to where one exists? (If you tell me atari.archive please give
me an idea of what directory it might be in.)

Thanks in advance.

>
>I agree. I thought this was one of the advantages of having the OS
>in ROM: fewer viruses. Isn't this why there are so many in the Mac
>and IBM world?

Well, you'd better NEVER power up with any disk in drive A. If the boot sector is executable, it'll be executed. And that's with a ROM OS!
If the boot sector is a virus, you'll get hit by a virus. That's all there is to a boot sector virus. It's true though, that there probably won't be many link viruses infesting command.com, cause there's no command.com.

Up to now, I haven't been hit by viruses (viri ? Argh, not again. :-) even though I use PCs with disk based OSes and STs with ROM based OSes, so in my opinion the danger is exaggerated.

So much for safety arguments.

Bye bye data,
Martin

Setting aside the question of how likely such a configuration is...

Surely you realize that an official Atari response is not only
unlikely, but actually a bad thing? Isn't this (pre-announcement
of product-turned-vapor) one of the things you hated most about
Atari in the late 80's? If real, let it appear on the shelves
before anyone from Atari says boo about it.

>Hi,
>
>Last month my original Atari mouse died (after three years intensive use),
>and I have to replace it.
....
>If it is not possible, what would be a good replacement for the Atari mouse?

My Atari mouse died last week, and I swore that I would never buy similar one: Often the buttons on it would not work without spending a lot of time adjusting the two philips screws on the back, and I had a constant problem with the sensors in the mouse going out-- I have spent many hours twiddling around with the innards, attempting to get the mouse to stop converting "down" movements to "up" movements. Very frustrating.

Last week I ordered the Golden Image mouse for about $52.00, including two-day delivery from a mail order company (I believe it was Computability) I wish I had ordered this mouse *years* ago. It weighs hardly anything, literally floats on the mouse pad, has at least three feet of mouse cable, and the buttons have a definate "click" to them; they are "true" mechanical buttons as opposed to the Atari's plastic "push-me-downs". The mouse also has a built-in accellerator; the movements are fantastically speeded up, esp. with software accelerators. I am one happy user with this mouse, and my only regret with the Golden Image mouse is that I didn't buy it years ago, even when my Atari Mouse was working.

BTW, I am not associated with Golden Image, or any other computer firm whatsoever. I just know what I like.

Message-ID: <1990Nov14.095130.424@ioe.lon.ac.uk>
Source record: 237254

I recently bought the TOS 1.4 (UK) upgrade kit. On each of the chips is a checksum. Does anyone know how this is calculated? I tried obvious things such as summing alternate bytes of the first 64K, but couldn't get anything like the correct values.

(I have no reason to believe my ROMS are corrupt - they seem to work fine. I'm just curious as to how the checksums are calculated).

Newsgroup: comp.sys.atari.st
Date: 1990-11-14 09:52:39 UTC
From: dh@tardis.cs.ed.ac.uk
Message-ID: <sent.Wed.Nov.14.09
Source record: 237255

Someone mail me about the new Atari Jaguar but I can't reply to them cos my mail is unintelligent!

Anyway...they said that they thought what I meant about the Atari Jaguar was the new Atari Panther.

This is not so...the Atari Panther is a cut down games console based on the ST...basically a ST without a keyboard or disc drive. Apparently it will be launched at Comdex this week.

However, the Jaguar is a different machine....it will be 68020 based with fancy graphics hardware probably. As I said, it will be a completly different machine from the Panther Console.

Oops....just noticed..the second word in this letter should read "mailed"!

Anyway..can anyone shed any light on Atari's new naming policy <grin>

First the Lynx, then the Panther (console), and now the Jaguar.

Richard

3237. VIDEO GAME RATINGS REPORT #1 [ATARI]

Newsgroup: comp.sys.atari.st
Date: 1990-11-14 11:00:05 UTC
From: erc@radon.berkeley.edu
Message-ID: <39560@ucbvax.BERKELEY.EDU>
Source record: 237257
Cross-posted to: rec.games.video,rec.games.misc,comp.sys.atari.st

For information on the list format and on submitting your ratings, see
the end of this posting.

ATARI GAME RATINGS REPORT

ATARI LYNX
New Distribution Votes Rank Title
..0011112. 18 6.8 Blue Lightning
0.0001301. 24 6.3 California Games
..0.010221 22 7.9 Chip's Challenge
..0221110. 18 5.7 Electrocop
1...11220. 18 6.3 Gates Of Zendocon
0..11310.. 16 5.6 Gauntlet III
......1025 12 9.1 Klax
.....1423. 10 7.7 Slime World
* ....3.33.. 3 6.7 Xenophobe

ATARI ST
New Distribution Votes Rank Title
* ....*. 1 9.0 Cadaver
* ....55 2 9.5 Dungeon Master
* ....*.. 1 8.0 Falcon
* ......*... 1 7.0 Flight Simulator
* ....55 2 9.5 Populous
* ....*. 1 9.0 Simcity

In this list, games have been rated on a scale of 1 to 10, 10 being the
best and 1 being the worst. For each game, the total number of votes,
the average rating, and the vote distribution are shown. New games are
indicated by a "*" before their entry. If a "(C)" appears after the
title it means that the game is a CD-ROM or disc system title. If a
"(J)" appears after the title it means that the game is currently only
available in Japan.

The general guideline for ratings is:

8-10 worth buying at full price
6-7 worth buying at a discount, or if you're particularly interested
in this kind of game
3-5 only worth renting
2 only worth playing for free, and only for a few minutes
1 worthless

The vote distribution uses a single character to represent the
percentage of votes for each ranking. The following character codes can

appear:

"." no votes cast "3" 30-39% of the votes "7" 70-79% of the votes
"0" 1-9% of the votes "4" 40-49% of the votes "8" 80-89% of the votes
"1" 10-19% of the votes "5" 50-59% of the votes "9" 90-99% of the votes
"2" 20-29% of the votes "6" 60-69% of the votes "*" 100% of the votes

To cast your votes, send mail to either of the below addresses:
video@irss.njit.edu
..!uunet!irss.njit.edu!video

In your mail, any line beginning with the word "vote" will be considered a vote. ALL OTHER LINES ARE IGNORED. Votes should be in the form:

vote [rating] [system code] [title]

where [rating] is an integer between 1 and 10, [system code] is a TWO-LETTER code describing the system the game is for, and [title] is everything on the line after [system code]. The system codes are:

AL = Atari Lynx AM = Commodore Amiga
GB = Nintendo Game Boy GS = Apple II GS
MA = Apple Macintosh NE = Nintendo NES and Famicom
PC = IBM PC, PS/2, and compatibles SG = Sega Genesis and MegaDrive
SM = Sega Master System ST = Atari ST
TG = NEC TurboGrafx-16, TurboExpress, and PC Engine

PLEASE NOTE THAT SEVERAL THINGS HAVE CHANGED WITH THIS SYSTEM. First, the system code is now a TWO-LETTER code, not a one-letter code. Second, the Atari 2600/7800 was removed as a system and the Commodore Amiga, Apple II GS, Apple Macintosh, IBM PC and PS/2, and Atari ST were added. Future additions include the SNK Neo Geo and the Nintendo Super Famicom.

Also note that the Nintendo Entertainment System and the Famicom are similair but NOT compatible. Same goes for the NEC TurboGrafx-16 and PC Engine. TG-16 CD-ROM games will most likely NOT work with the TurboExpress (but don't quote me on that).

Range of systems available subject to change based on volume of votes.

Case is not considered in game titles or system codes. Valid votes might be:

vote 8 sG Ghouls 'N Ghosts
vote 1 Ne friday the 13th

To make things easy, the reply-to field of this posting is set to the rating server. Simply hit "r" to send in your votes.

The code for this rating service, and much of this text, was provided by Chuck Musciano. John Leo modified the code to support video game ratings. Eric Ng, the new maintainer, added personal computers and provided for sub-dividing the list into pieces for easier reading, and is the one to blame now.

Questions, comments, and problems should be directed to the list
maintainer at either of the below addresses:

3238. ST => Transputer???

Newsgroup: comp.sys.atari.st
Date: 1990-11-14 11:07:30 UTC
From: csual@warwick.ac.uk
Message-ID: <1990Nov14.110730.5236@warwick.ac.uk>
Source record: 237258

For those of you who don't/can't get it, month's edition of ST Format has a 'World Exclusive' on a new ST add-on which sounds *extremely* cool. It's a plug in transputer, which they claim is going to cost about the price of a printer, which I would read as 300-400 pounds. Who needs blitters and dedicated sound chips when you can have dedicated graphics/sound PROCESSORS??? I haven't got the magazine with me - if people want more details (there weren't that many anyway, except that it is expected about mid to late 1991), let me know and I will put a more detailed post out.

Cheers,
Jas.

I can't answer your question directly, but I can point you to the last two issues of STart magazine (October, which has 'September' on the cover, and November 1990). Both have had programming articles related to the blitter chip and demo some of the supposed advantages of the chip.

That's interesting... I happen to have a hard disk too, and my floppy
is viri-protected (I assume by a program in the boot sector) by George
Woodside's vkiller. Anyway, even though I boot from the hd, it always
executes the boot sector on the floppy !
One of us has to be wrong, then...

3243. How do I tell Rwabs() I've got a DS disk

Newsgroup: comp.sys.atari.st
Date: 1990-11-14 15:10:21 UTC
From: teexand@ioe.lon.ac.uk
Message-ID: <1990Nov14.151021.7946@ioe.lon.ac.uk>
Source record: 237263

I've noticed that if I use Rwabs() to write to the floppy in drive B, and no access of drive B has been made since reset, TOS assumes the disk is single sided. Hence, attempting to write higher numbered blocks cause the heads to seek beyond the end of the disk (ouch!). This is presumably because the BPB isn't correctly set up at the time of calling. Normally, I would just call Getbpb(), except in this case I've haven't written the boot sector yet, so it isn't valid. Since the BPB isn't in a fixed place across TOS versions, is there any way of locating it without calling Getbpb(). Even if this can be achieved, is it then safe to start changing the contents? There appears to be some extra structure members at the end that aren't documented.

Any suggestions?

3244. Kbshift() during startup

Newsgroup: comp.sys.atari.st
Date: 1990-11-14 15:27:43 UTC
From: teexand@ioe.lon.ac.uk
Message-ID: <1990Nov14.152743.8373@ioe.lon.ac.uk>
Source record: 237264

Since upgrading from TOS 1.0 to 1.4 I've been having some problems with programs in the \AUTO folder. Specifically, I have a couple of programs in there that react to modifier keys (Shift, Control, etc) being held down. Under 1.0, I'd simply hold down the key immediately after turning on the power, and the programs would respond accordingly. Under 1.4 this doesn't seem to work. I wrote a short test program and it seems that Kbshift() isn't telling the truth. Further investigation suggests that it does sometimes work if you press the modifier key shortly after turning on. This is difficult to time correctly as the program is the first one in the \AUTO folder. Has anyone else had similar experiences? Any advice?

Hello!

I am getting a MEGA 4...whenever the DAM THING GETS HERE, and I and a few of my friends are pondering just what good a blitter chip actually is on the ST, and if it offers any advantages over the software blitters.

Some of the technical stuff I have seen suggests that the blitter is mainly meant to off load cpu time so the 68000 can be doing other things instead of doing blit's.

Thats the only advantages I can see over the software blitters, anyone get this impression from line-A SALAD stuff???

>
> If you meant this as a snide comment, then err, why did you bother?

The quote above comes from the press release about SLICCTOP; I'm sorry
if this is unclear. My own opinion is that SLICCTOP's claim is pure
hyperbole. It sounds like an interesting product, but not necessarily
any "superior" to RTX (which at the least has the advantage of being
a mature product) or to my own MiNT system.

In any event, I think the context makes it clear that the discussion is
about *atari* multitasking systems only, i.e. SLICCTOP is claiming that
their system is the best multitasking system *for the atari*. I doubt
that even SLICCWARE would claim that their system is better than, say,
NeXTStep.

3249. GFA BASIC and C

Newsgroup: comp.sys.atari.st
Date: 1990-11-14 17:30:48 UTC
From: tasayco@phoenix.Princeton.EDU
Message-ID: <4058@idunno.Princeton.EDU>
Source record: 237269

I received the following message from a person who needs help in
interfacing GFA BASIC with C, and cannot post to the net. If somebody
can help him please send mail to 21c19@titan.hts.hsa.nl

Hi !
I have a problem using C in GFA-basic and since you seem to know quite a lot
of C-language, I mailed you. (We are not allowed to post articles).
The problem is that I have a certain basic-program, which uses a routine
very much, so I have written this routine in C.
(The routine calculates the determinant-value of a matrix).
You can call a C-routine in gfa by the command :
var = C:adress(param1,param2,param3 etc)
where adress is the starting-adress of the C-compiled program.
This command does not seem to work quite well, the c program is not executed
and the interpreter returns with the error "three bombs bus error."
So I made a very simple program just to test the command. The program :

```
adress=MALLOC(2000) ! reserve 2kbytes of memory for program
BLOAD "A:\PROGRAM.PRG",adress ! Load program in reserved memory
result = C:adress() ! No parameters, execute c program
dummy=MFREE(adress) ! release reserved memory
```

The c-source :

```
#include <stdio.h>

float main()
{
printf("This is a c program");
}
```

I am using the Turbo-C compiler.
Do you know a solution to this problem ?
If not, would you please be so kind to post the article on comp.sys.atari.st ?

Thanks in advance,
Roland (HTS Alkmaar, The Netherlands)

carlos@stretch.cs.mun.ca (Carlos Borges) writes:
>I don't know if it's a legal atari product or not.

It's not. No RAM-loadable part of the OS has EVER been an official Atari product except the original RAM TOS back in 1985, and GDOS. Everything else is either hacked out of the ROMs and made into a PRG, or was an internal test release that should have stayed internal. In any case such programs are NOT official, are probably PRE-RELEASE, TEST versions, and they are likely to have BUGS. What good is a cool new desktop if it eats your files when you try to copy them one day?

>Maybe someone's idea of a joke.

We're not laughing.

Earlier, Derek Mui from Atari posted a message saying, in part, "If you want to use this (potentially buggy) thing, that's fine with us." He misspoke. It is not fine with us. It is illegal, and in fact you are probably dealing with stolen property. He meant something more akin to "If you want to use it, it's your funeral," meaning Atari (and by extension Derek himself) wouldn't take responsibility for the results.

That version is a PIRATED and beta version of TOS. Please don't use it. It's a violation of Atari's copyrights on TOS and it had some bugs in it that could cause you endless grief.

Also, please ask the ftp site to STOP distributing it. It's illegal.

To add one more Atari voice into the fray :: THE USE AND DISTRIBUTION
OF THESE PROGRAMS IS SIMPLY AND BLATANTLY ILLEGAL!! It is THEFT!

If you found a copy of Mark Williams "C" on a BB, would you spread the
word so everybody could get a free copy? Maybe a copy of Turbo "C"? How about
PC Ditto's sitting out on the loading dock of a warehouse? How about Spectre
GCR's, also from a loading dock?

Until you hear an announcement from us, the use of any such programs
is simply theft. Even after such an announcement, you should get such copies
legally.

Look, many of you are software/hardware developers for Atari products.
How would you feel if it were early, unreleased, (or released, for that matter)
versions of YOUR product?

Irregardless of the theft issue, you (like we) would probably not want
to inflict an early, buggy, piece of software onto the Atari "community".

Instead of gleefully spreading this around, how about showing some
professionalism and integrity, and help put an end to it?

TRH

[If you don't like my attitude, send me mail rather than cluttering up the
newsgroup. Also recognize that this is from a HARDWARE developer's point of
view rather than SOFTWARE]

3255. UniTerm and Z-modem

Newsgroup: comp.sys.atari.st
Date: 1990-11-14 19:00:56 UTC
From: david10@stretch.cs.mun.ca
Message-ID: <1990Nov14.190056.1444@stretch.cs.mun.ca>
Source record: 237275

I'm sure this has been asked before, but . . . how does one get z-modem
and UniTerm to work together? For example, I've tried running rz.ttp from
a function key using "%run('rz.ttp, '')". It asked for the commandline, and
then I received TOS error #39. Running it from "run prg..." in the menu
did the same thing. What am I doing wrong?

I am using UniTerm 2.0c 010, and have placed rz.ttp and sz.ttp in the same
directory as uniterm.prg.

Thanks in advance,

Dave C.

The ST will look to the boot sector of the floppy disk to see if it is executable before booting the HD. However, this does not mean that the HD needs to have the floppy in the drive. I read an article not long ago that stated the boot up procedure was like this: (I think Dave Small wrote it)

1. The ST looks to the floppy and checks to see if it is autobooting. (try putting a autobooting game and see if your hard drive starts up.)

2. If the disk is not autobooting, or the disk IS NOT THERE, then it will try to boot the hard drive. (this happens on systems with no HD also)

3. If the hard drive is not autobooting, or there is no hard drive then control returns to the floppy drive and the auto folder.

4. If there is still no floppy disk, then the default desktop comes up.

Note: This is for TOS in ROM.

So Yes, the Hard drive does check the boot sector, but it is not needed to boot a hard drive that is Autobooting. Note that it will take slightly longer if there is not disk in the drive because the floppy drive must time out before control passes to the Hard drive.

You can see this process at work on your own system by setting up cases that fail one of the above conditions (ie put a autobooting game disk, or turn off your hard drive and boot without a floppy in the drive).

I heard that Atari offers Student discounts as well. I don't know much about it as I bought my MEGA well over 2 and a half years ago. What Atari should do if it wants to attempt to get into schools with the ST/E/STacy/TT is hit all the big MUSIC schools. Donate a few machines to the campus and then put up booths at the computer forums on campus to sell them. Against the Mac and IBM they should easily win, especially with the GCR and PC Speed out there. Think how well Atari could do with a small push like this!

3260. Why won't GCC work ???

Newsgroup: comp.sys.atari.st
Date: 1990-11-14 20:43:15 UTC
From: longj@lonex.radc.af.mil
Message-ID: <1990Nov14.204315.14160@lonex.radc.af.mil>
Source record: 237280

I am having a heck of a time getting GCC working on our 4 Meg 1040ST
with TOS1.2 here at work. After convincing my fellow workers that GCC would
be the greatest thing since sliced bread, I grabbed the executables, incl,
libs and installed it all. I modified the sample gnu.g file to conform
to the setup and whenever I run the obligitory hello.c test, I get the
following in response to my commands:

```
>cc -v hello.c -o hello.prg

gcc version 1.37.1
c:\gnu\bin\gcc-cpp.ttp -v -undef -D__GNUC__ -Datarist -Dgen -Dm68k
e:\hello.c d:/cc10000.cpp
^^^^^^^^^^^^^^^^
...
...
...
d:/cc10000.cpp : file not found
d:/cc10000.s : file not found
```

I suspect the problem has to do with the forward slashes in the temp dir
d:/ (my gulam.g has TEMP=d:)

Can anyone help me save face soon??

>
>Any suggestions?

Number of sides isn't the only thing Rwabs() needs to know in order to write to your disk. It also needs to know number of tracks, number of sectors per track, sector size, and so forth. These things are determined when the disk is formatted and stored in the boot sector. They are read by TOS when you do Getbpb(). I can't imagine why you want to write to a disk without reading its boot sector first. It seems like a really bad idea to make assumptions about the disk that happens to be in the drive instead of reading what is actually there.

On the other hand, if the disk isn't a TOS disk at all and you just want raw access to the sectors which you believe and hope are there, then use Floprd() and Flopwr() directly. You specify side, track, and sector and they do the rest.

Well, my 1040ST (and I'm working right now on it) when linked to my MegaFile 60 (and it always is), always boots from the harddisk. Whether or not there is a floppy in the drive. But I am told this is TOS specific. I use TOS 1.4.

Greetings fellow Atari users.

A while back, I advertised a bunch of ST software I wanted to (re) sell here (totally legal, original copies with all docs-- stuff I don't use anymore, basically.) I have sold all but:

Mark Williams C v. 2.0 available for $40
Manhunter: NY available for $15 (cool game, includes hint book too)

I now have 2, soon to be 3, satisfied customers (okay, McDonalds isn't worried) so's you guys know I am trustworthy.

If you want any of the aforementioned stuff, email me here at CMU. Oh, and BTW, I have found that COD is too expensive to be worth it. So if you're placing an order, please be aware that I'll need to receive a check from you before I mail the stuff, and that the software will be shipped USPS third class. Enables me to keep the prices low.

A "bootable" floppy is one with an executable boot sector (checksum $1234). If you have a "bootable" floppy in the drive, the boot sector will be executed before the hard disk is hit. The executable code in the boot sector can, for example, install a virus, then end with "rts" to return to the ROMs, at which time the hard disk will boot. This is how the Key virus (and all other boot-sector viruses) work.

You are safe from them if you have a disk in the drive which does NOT have an executable boot sector, or no disk at all. It's best to write-protect this disk, so nothing can write a virus into the boot sector.

This was the answer I got after requesting that a bad disk be
replaced. I received a bad copy of Quick ST II several months ago, I
promptly returned it with a request for a replacement. They have
repeatedly ignored my reasonable requests for a working replacement.
What kind of customer support is this? Would Mr. Mihocka prefer that
everyone pirated his software?

mboen@nixdorf.de (Martin Boening) writes:

- Well, you'd better NEVER power up with any disk in drive A. If the
- boot sector is executable, it'll be executed. And that's with a ROM
- OS! If the boot sector is a virus, you'll get hit by a virus.
- That's all there is to a boot sector virus.

Well, I ALWAYS power up with a disk in drive A. The boot sector on my disk is never executable. On the other hand, I accidentally booted a disk last night with a virus on it, and as soon as I accessed the disk, I got a skull on the left side of my screen. The skull is the result of a program in HOSPITAL.ARC which checks for viruses. If a virus is loaded into memory, the skull appears and locks up the machine. I couldn't do a hardware reset with the reset button, nor a coldboot with CTRL-ALT-RightSHIFT-DEL.

Another trick to avoiding viruses is looking for the 'E' on the information line of NeoDesk 3. This will tell you if a disk has an executable boot sector on it. I've found quite a few viruses, mostly the Key/Signum virus, this way.

From: swood@vela.acs.oakland.edu
Message-ID: <3862@vela.acs.oakland.edu>
Source record: 237291

I was looking real interestingly at the MichTron IBM PC emulator, but I just called accrossed town, and the MichTron number is disconnected, and the phone company has not listing at all for MichTron. So, I either need to know if there is a new location for MichTron, or what are some good emulators?

I would prefer something that I can switch back to use my ST as an ST. I don't know much about emulators, or how they work for the ST, so this may be a standard option, or may be a possibility. I have heard that most of the better emulators are teh hardware versions that are installed internally into the ST. Does that mean that it no longer uses the mac Processor?

I have a need arising in the future to use a PC with a 80?88 processor, and would also like to know if there are any emulators that would allow for 80?88 type processing for assembly code.

If there are any suggestions, I would appreciate it.

Thanks

swood

Source record: 237292

I have ordered the GCC binaries from cs.uni-sb.de three times, and the archive has been contaminated (CRC error) every time. I DID set BINARY mode each time (I never have problems with atari.archive). The following files arrived each time:

gcc-progs.zoo.aa
gcc-progs.zoo.ab
gcc-progs.zoo.ac
gcc-progs.zoo.ad

However, when I enter

cat gcc-progs.zoo.* > gcc-progs.zoo

on the Sun SparcStation, then type

zoo -test gcc-progs

There is always a CRC error. Is the archive OK at uni-sb? Am I doing something wrong? Thank you for any help.

3273. How to hook-up a MicroSoft mouse to an Atari ST

Newsgroup: comp.sys.atari.st
Date: 1990-11-15 03:41:49 UTC
From: jeff@onion.pdx.com
Message-ID: <1990Nov15.034149.15109@onion.pdx.com>
Source record: 237293

Here's a repost of my article of wayyyy back (Feb 1989) on how to hook an Microsoft mouse to an Atari ST. No software changes are required. All it takes is creating a special cable between the mouse and the Atari.

I've been using a Microsoft mouse now for around 2 years on my 1040, with nary a glitch. It's so much better than the Atari mouse, I'd never go back. (IMHO)

Well, here is how to connect a Microsoft Mouse to an Atari ST. (520/1040) The Atari has a 9-pin D-type connector. The Microsoft Mouse has a rather strange connector on the end. To prevent having to cut the mouse cable up, I made this adaptor. If you still can't follow it, please let me know and I'll try to redescribe it. This does work for me. I've been using it for 6 or so months now [Note, it's been 2 years now!] with no problems at all. It does take some soldering skills, so if you're not so hot at soldering, find a friend to help.

As far as I know, this does not effect your Atari's warranty. However, I have not asked Atari.

```
Atari ST Microsoft Mouse ST expected signal
----- -- --------- ----- -- -------- ------
1 5 XB
2 3 XA
3 8 YA
4 9 YB
5 N/C N/C
6 2 Left button
7 N/C +5VDC (N/C)
8* 6 and also tie to pin 1 Ground
9 7 Right button
```

* = I am not sure why I have pins 6 & 1 tied together, but it does work.

The Microsoft mouse connector looks like this. This is the solder side, with the leads pointing up.

```
---------------
| 1 |
| 2 3 4 5 |
| 6 7 8 9 10 |
| |
---------------
```

If you can not use the connector, the pins are numbered as follows. This is the connector side from the Microsoft Mouse plug:

```
/------------\ This is a view at the front of the connector.
/ Blank "KEY" \ It is where the plug from the mouse would be.
/----------------\ The pin labeled 'n' is not connected.
| n 4 X 8 | The place labeled 'X' is filled, and does not
| 9 7 1 2 | have a pin.
| 5 6 |
\ /
\------------/
```

Have fun!

-Jeff

Does this mean you have found such a virus? I was under the impression that this type has not yet been seen on the ST. George Woodside would probably like to get a copy of it if you have found one, so he can incorporate it into his VKILLER program (an excellent piece of software). Yeeesh, another thing to worry about!

3279. ATonce

Newsgroup: comp.sys.atari.st
Date: 1990-11-15 09:46:16 UTC
From: Erik-jan.Vens@samba.acs.unc.edu
Message-ID: <1636@beguine.UUCP>
Source record: 237299

Hi,

I bought ATonce a week ago and had a friend (who is doing this professionaly) build it into my 1040ST. I also installed 3Meg of X-tra RAM. The RAM seems to be OK. I had the CheckRAM program run all night and it didn't encounter problems.

But, I am having problems with ATonce. Booting from floppy works OK. But it doesn't seem to work with my harddisk. I have partitioned my harddisk (MegaFile 60) in 6 partitions: 3 times 1 small and 1 big partition. The small ones being 'boot partitions' (one for TOS, one for DOS and one for MINIX), the big ones 'work partitions'. Now you can configure ATonce to recognize any partition as C:. And since E: and F: are my DOS disks, I have configured E: to be DOS' C:.

So far, so good. I boot PC-DOS 3.30 from floppie. I now have to make the DOS' C: drive bootable, so I do a FORMAT C:/S which should do the trick. It starts formatting then asks for a DOS system disk in drive A: to install COMMAND.COM (and IBMBIO I guess). These are present on the disk when I check. Now I changedir to C: and I make a directory SYS and SYS\TOOLS. I copy all DOS commands to SYS and the ATonce specific files to SYS\TOOLS. And now the trouble begins.

The directory listing of SYS contains noise: strange characters etc. So, if I change back to TOS and take a look at the directory, it looks pretty messy. (You know the: +=8*-3%$ bytes used in 1676453 items).

If I make the system clean, then repeat the procedures, but fill the directories under TOS (that should give the same result), I get the same trouble.

Has anyone encountered such a problem before? How should I proceed? Is it the DOS I am using? Maybe it should be not PCDOS but MSDOS? I do not know how the BIOS is handled under ATonce.

Erik-Jan. Vens@Rug.NL

3280. Re: Disk based TOS2.0, Viruses, etc...

Newsgroup: comp.sys.atari.st
Date: 1990-11-15 10:15:57 UTC
From: dac@ukc.ac.uk
Message-ID: <6156@harrier.ukc.ac.uk>
Source record: 237300

After all the comments about the possibility of virus infection when using a hard disk based TOS I think it's time to take a step back to remember the real issue... TOS2.0. I would like to see the Atari OS and future upgrades on disk - maybe not exclusively, but as an option for people who want it.

We can discuss for ever the problem of viruses - the fact is that no matter how you load your OS, a determined person could write a virus which could take your system down. If a virus infected your OS image on disk and then, after a while, trashed the whole of your hard disk then that's obviously bad news. But with a ROM OS the same thing could happen only instead of infecting your OS the virus would infect something else... there is no 100% security... ever. If you get PD/shareware software then you're at risk. If you buy commercial software there's still a possibility of infection. Viruses exist and trojans exist and that's that... and whether your OS is in ROM, RAM, booted from ROM, DISK, tape, punched cards or a hex entry keypad, it won't beat a determined virus. Let's be paranoid for a moment... That copy of Gulam you use... or Uniterm, Mint, MicroRTX or whatever... Did you download that from an archive or copy it from a friend? A friend? Hmmm... Did your friend have it on floppy? If so, does he ever let other people borrow these disks? Are you sure the 8th person before you didn't have a virus in his machine when he took his copy? If you got your software from an archive, who else has write permission on that archive? When's the last time the administrator changed his password?

Viruses are a real problem, but I don't think they are an issue in the disk based TOS argument. I feel that a disk based OS from Atari would be a plus in that a) it would be cheap, b) it wouldn't involve opening up your machine or sending it off for eight weeks and c) it would be possible to distribute via usenet at, effectively, no distribution cost to Atari.

Maybe I've got a naive or simplistic attitude, but I'd like to think there's a level of support for this idea.

Dave.

That's interesting... I happen to have a hard disk too, and my floppy
is viri-protected (I assume by a program in the boot sector) by George
Woodside's vkiller. Anyway, even though I boot from the hd, it always
executes the boot sector on the floppy !
One of us has to be wrong, then...

If I got you right, your system (if floppy inserted in drive) executes floppy's boot sector and then boots from hd, right? I have not tested that... Maybe mine do the same thing... I just thought that if it excutes boot sector from a floppy, it can't anymore go on booting from hd.

Assume that your boot sector on a floppy has code to load disk-based TOS (really old one) from a floppy. Will your system still somehow boot from hd? How?

WEL
Welcome to comp.sys.atari.st
============================

This newsgroup is devoted to discussion about 16 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, and STacy.
There are also emulators for the Apple Macintosh and IBM XT available.
Finally, there is the Lynx (a game machine) and the Atari TT and ATW.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.

Associated newsgroups include:

comp.binaries.atari.st
comp.sys.atari.st.tech
comp.sources.atari.st

CSAST
What sort of articles would interest people reading comp.sys.atari.st?
```

==========

The most interesting articles are technical articles, impressions of software/hardware, information on Atari user-groups and shows, or helpful hints on how to make better use of the machine and its software.

The least interesting articles are in the form of 'my computer is better than...', especially when cross-posted outside of comp.sys.atari.st. If you don't know how to eliminate other newsgroups from a reply to an article which is cross-posted, ask your systems administrator.

'FOR-SALE' articles should be posted to misc.forsale, and ONLY local distribution of comp.sys.atari.st. Those outside the United States have little desire to read about that neat bit of [hard/soft]ware you're selling when you live in the U.S.A. If you don't know how to restrict distribution of a posting, ask your systems administrator.

Many articles are in the form of "How do I...?" or "Where do I...?" In this article, I will try to answer some of the most-often asked questions.

PD
Where can I get Public Domain/Shareware software?
==========
Thanks go out to Russ Evans, Rainer Klute, and Edgar Roeder for the European information.

There are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st mail server. You can also try the commercial on-line services such as GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those ending with the suffix of .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

For anonymous FTP: atari.archive.umich.edu [141.211.164.8]

User anonymous
<enter password>
cd /atari

The atari.archive server is now available via e-mail as well. To find out more about bart (the mail server), send a message to atari@atari.archive.umich.edu with a body of "help". You will get a message back with the help file.

For anonymous FTP in the UK: uk.ac.lancs.pdsoft

User pdsoft
Password pdsoft

This is a national public domain archive, available to sites in the UK only via JANET. Mail access is available from within the UK - send mail to archive-server@lancs.pdsoft for information.

For anonymous FTP in Europe: unido.informatik.uni-dortmund.de
[129.217.64.60]

Some selected Atari ST software is in the directory pub/comp/atari-st

There is also the info-server, a mail server which (among other things) mirrors the panarthea archives. Unfortunately it is not up to date and presently contains only volumes 1-10. You can get more info about the server by sending any mail to info-server@unido.informatik.uni-dortmund.de. It will reply with usage instructions.

For anonymous FTP in Europe: cs.uni-sb.de [134.96.7.254]

Contains the most interesting tools of the german PD-scene, most of the GNU programs ported to the ST (including ports of emacs and bash and an extended version of bammis library for gcc) and also ports of software posted to comp.sources.unix, alt.sources and comp.sources.misc.

For the panarthea mail server, see Steven Grimm's monthly posting.
Panarthea holds all of the comp.sources.atari.st/comp.binaries.atari.st postings. If you aren't reading these two newsgroups, you should consider doing so.

ARCS
How do I deal with Archived files (.ZOO, .ARC, .LZH)?
==========

Files ending with suffixes .ZOO, .ARC and .LZH are archive files. They are binary files which may contain one or more other files in a compressed format. Archive files usually take up less disk space, and for this reason have become quite popular for transferring large files via modem.

In order to extract the files from an archive file, one must use an archive program. Here are the correspondences:

ARC Use ARC.TTP
LZH Use LHARC.TTP
ZOO Use ZOO.TTP

These programs are all available via FTP from the atari.archive server, in the /atari/archivers directory. Recommended files are:

arc.ttp - needed to extract the other archivers, once.
arc_602.arc - latest version of ARC, with the most fancy features
and quite a lot of documentation
lharc.arc
zoo_bin.arc

There are also several GEM programs which act as 'shells' for the archive programs. The most popular are Shareware offerings, also available on atari.archive server. They are:

arcgsh31.arc - European in origin
located in /atari/Binaries/volume12/arcgsh31
arcsh197.arc - US in origin
located in /atari/archivers

The GEM shells are recommended for inexperienced users (and appear to be quite handy for the experienced user as well!) They require a copy of the archive program -- in other words you need BOTH the GEM shell *AND* the archive program in order to use the GEM shell.

Documentation on the use of the archive programs should accompany the archive files mentioned above. To use ARC.TTP in order to extract these files, use the command line:

xh xxxx.ARC *.*

where 'xxxx' is replaced by 'arc_602', 'zoo_bin', etc. For example

xh arc_602.arc *.*

will place all files within the arc_602.arc into the current directory. It assumes you've clicked on the ARC.TTP program from the Desktop and have the parameter dialogue box on your screen.

In many cases, simply typing a '?' or 'h' will provide an extensive list of available options.

Source and binary code for archive programs have also been posted to comp.sources.atari.st and comp.binaries.atari.st. They are available via e-mail through the panarthea archive server. See Steven Grimm's posting for more information on how to obtain files from panarthea.

ERR
What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

Below is a letter, originally written by Darryl May,
that John Townsend of Atari posted on GEnie in January to provide some answers. This letter also appeared in the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA 22170).

Dear ATARI customer,

The following is an official list of the errors that can appear while you are operating your ST computer. This first list gives you the GEM error messages:

Error description GEM Error code
==========
OK (no error).....0
Fundamental error.....1
Drive not ready.....2

PAINT
What is the format for [x] paint program data?
==========

There is a periodic posting of ST Picture Formats, edited by David Baggett.
The file is on the atari.archive server under /atari/graphics/picfmts.doc.

GDOS
What is GDOS, and where can I get it?
==========

GDOS stands for Graphic Device Output System (at least that's what my copy of
STart, volume 1 number 1 said...)

You can get a copy of "Everything You Ever Wanted to Know About GDOS (and
more)" by Douglas N. Wheeler from the atari.archive server. The file is
/atari/programming/gdos.arc.

There is a German version of GDOS available from the atari.archive server. The
file is /atari/utilities/amcgdos.arc.

Currently, there are no truly public domain sources for the GDOS system files
or font files (at least those supplied by Atari). You can get these files with
many commercial programs, such as Degas Elite, WordUp!, etc. You might also
want to check your local user group to see if they received a copy of the
WordFlair demo program (also available on GEnie). The demo program appears to
have the GDOS system and font files.

TEX
Is TeX/LaTeX available on the Atari ST?
==========

The TeX/LaTeX typesetting programs are available on the Atari ST. Check the
atari.archive server under /atari/tex, or the dsrgsun server under
pub/atari/StTeX (not accessible as of this date). Fonts and device drivers
(including one for the Epson 9-pin printers) are available on the
atari.archive server.

LANG
Public Domain/Shareware languages...
==========

Check the atari.archive server under /atari/languages. Currently included:

abc recently posted to comp.binaries.atari.st
apl demo version

forth Don't know which one. I recommend Bradley FORTH
icon
modula-2 From Germany
Sozobon C Most excellant
Elan
xlisp
xprolog
xscheme

GNUC
Is GNU C available on the Atari ST?
==========

You can also get the GNU C program, which runs on 1 megabyte Atari ST systems. For more than minor programming, you may need to upgrade to 2 or more megabytes, as the GNU programs generally assume you've got plenty memory.

GNU C for TOS is available via anonymous FTP on atari.archive. It is also available via anonymous FTP on cs.uni-sb.de [134.96.7.254]

ZNET
Where can I get copies of ZNET?
==========

ZNET on-line magazine is available on CompuServe and GEnie. You can also get copies mailed to you by sending an e-mail message to

stzmagazine-request@virginia.edu

indicating you wish to subscribe.

They won't get to you on Friday (which is when they're posted), but Greg Lindahl provides an excellent service to the networking community by sending these out.

ZNET and some information from the Current Notes user magazine are also available from the atari.archive server under /atari/magazines.

PALS
ST Pen Pals list
==========

Simon Chappell is compiling a list of people interested in exchanging paper-based mail "of interested parties who could then keep in touch and prevent themselves losing touch with the ST community at large (this would be especially easy if someone who still had net access could summarise current topics or forward news and advice!)"

He is accepting entries in this format:

eg Simon Chappell.
s61304@uk.ac.psw.pa (NOTE: NO LONGER VALID ADDRESS...)
51 Amherst Road, Penny-Come-Quick, Plymouth, Devon, PL3 4HJ. UK.
C, operating systems (UNIX, VMS) & relational databases.

Contact Simon at his paper mail address if you are interested.

BOOKS
What books are available for the Atari ST?

TIPS

TIPS AND HINTS from other users
==========

Any 'multisync' monitor which handles 70 video fields a second can be used with the ST; the custom cable involves no tricks, or commercial ones are available. The original NEC multisync does NOT handle 70 fields a sec.

More than 3 bombs often means more than 1 error, so interpretations are tricky.

An ST-formatted disk which is not readable by a PC can be made readable by putting the 3 bytes EB 34 90 (those were 3 bytes of hex) at the beginning of the boot sector (sector 1 of track 0, I believe). This can be done with either an ST or PC absolute sector editor.

Some (older) PC-3.5"-drives cannot deal with the short track-header produced by ST formatters. On those drives, ST-formatted disks are not readable, independent of their boot sector contents. The other way, however, does always work: format on the PC.

When using disks formatted on a PC in an ST, make sure to insert and access a disk with a different serial number in between disk changes.

From: mh4x+@andrew.cmu.edu
Message-ID: <UbEdI=200WAu02VEx_@andrew.cmu.edu>
Source record: 237153

Hello netland.

Just two quick questions:

1) Does anyone happen to know of any mailorder houses that seal in ST hardware/software.

also

2) What ST mags are still in publication. I have been out of the ST world for a while and have not been able to find any in the places that used to carry them.

Thanks,

Mark Hamill
mh4x@andrew.cmu.edu

3284. Re: TT Tos disk available in France...

In article <2739@atari.UUCP> apratt@atari.UUCP (Allan Pratt) writes:
>What good is a cool new
>desktop if it eats your files when you try to copy them one day?

That is what we have been wondering about the UK STe machines
with their faulty DMA chips. Atari UK still released them, then
for many months *insisted* that a problem didn't exist.

It is only now, after extensive articles in the computer press
we read that Atari UK has admitted there is a problem.
Apparently they are marking all STe machines with a red dot after
the serial number if they contain the new [fixed] DMA chip.
In spite of this, more than one large retailer has stopped selling
Atari computers altogether, and others have dropped their Atari
hard disks after Atari refused to change DMA chips for any customers
except those who had bought a Megafile. Thanks for the support, Atari.

>Bill Oswald
>aloft!wao

I bought the Golden Image mouse after my fourth Atari mouse went
uncontrollably berserk. I like it a lot. It was difficult to get used to
at first. It sends pulses so fast the keyboard chip can get confused and
the mouse pointer won't go where you tell it too. It takes a while to get
the feel right.
I don't know how many people have had trouble with the ST Mouse,
but a friend of mine who works for Triuf here in BC has found the problem
for one common problem. If the mouse slowly starts to lose one direction
(refuse to go left in all the mice I've had) it is caused by the opto-
transistor's bias wandering from spec.(cheap part). The biasing resistor
for that transistor can be replaced with one with a slightly different
resistance, and the mouse will work again for a while until the transistor
deteriorates further. I kept my last mouse working for about six extra months
by increasing the resistance when it started to screw up again.
If there's sufficient interest,I'll try to get my friend to work
up a file describing the fix. Interestingly enough, this only seems to happen
with the Tiawanese mice. Two people I know have the Japanese and German
mice and they haven't had any problems. Both of thtose mice are 3+ years old.

ZCOMDEX2.TXT

Day One, Report Two: Monday, November 12, 1990
By John Nagy for Z*NET, LIVE AT COMDEX, Not just Message Reprints.

The first day of Comdex is over, and I now sit wearily in the plush
Caesar's Palace, ruminating over the day's events. It has been
pretty good for Atari.

This Fall Comdex spans 2.2 MILLION square feet, and perhaps even
MORE than 2.2 million SORE feet. The crowds are at least as large as
ever, although there was much more traffic in the "established"
convention halls than there was in the Sands Exposition and
Convention Center (SECC), the brand new facility that helps make
this Comdex 20% larger than any ever before. Unfortunetly, Atari
Corp is in the new SECC, and enjoyed less than throngs of people
today. The traffic grew throughout the day, however, and most of us
expect that the newness of the facility (this is the FIRST show of
any kind in it, they just opened days ago) will wear off and that
Comdex "regulars" will visit the hall later in the week.

The Atari exhibit looked even better today, with the last of the
boxes and plastic carpet protectors put away, revealing further

division between the "Home Computing" and "Business" areas of the booth. The Home area is about 20% of the booth, separated by a wide isle of burgundy carpet that exactly matches the regular isles. The visual impact is that Atari has two adjacent booths. As mentioned in the last report, I am told that at CES, the same concept will be used, with the proportions reversed.

Third party developers are again the focus of much of the booth. It was worthwhile coming to this COMDEX if only to see BOTH Dave Small AND Charles F. Johnson in sport coats and ties... that aren't just painted on t-shirts! They were showing the Mac emulator SPECTRE GCR (with version 3.0 software) and the Codehead products, respectively. And you should see SPECTRE flying on the TT030! Dave estimates that it runs about four times the speed of the GCR on a ST, clocking in right at about MAC II performance. Simultaneous demos on a TT and a Mega (old version) made me think a 4 factor is too low... it was FAST.

I have been asked for QUICKINDEX numbers for the new TT and 16 Mhz MEGA/STE, and I will comply in my next report. So far, the numbers look a bit odd to my eye, and I want to verify the levelness of the playfield.

Also present: Gribnif with NEODESK 3, also showing a new CLI (still beta testing) that will run ANY .TOS program IN A GEM WINDOW, even LHARC! Goldleaf was showing the beta version of WordFlair 2 that will ship at the end of the year. It DOES include an integrated spell checker. TALON is showing their IBM emulators... yes, emulatorS. Earl Miller says he now is the exclusive US distributor of PC-SPEED (now at only $199!!) and AT-SPEED, and is co-distributor of both ATonce and Supercharger. Talk about cornering a good market!

Nathan Potechin has several workstations going showing Calamus and Dynacadd (in color!) on TT030 units. The new Phillips-built 19" monitor really looks good, and the Atari SLM605 laser printer produced some of the most flawless, fastest first copies I have seen. Forget about the 605 being 6 instead of 8 copies a minute (as the old SLM804 was rated). The first copy is FASTER... dunno why, but I don't care either. Just gimme one.

I'll have more on the attending vendors in the next report.

Atari showed their new FSM GDOS, to be released this winter, perhaps as a freeware update to the world! This outline font technology updates the old and limited GDOS system to provide completely scalable and rotatable GDOS fonts. The outlines will be standard Ultrascript outlines, although from the IBM family of fonts rather than the Atari ST Ultrascript family. The added interchangability is probably worth the inconvenience to existing ST Ultrascript users. WordFlair really looked GOOD and FAST with the new GDOS.

On hand were Jack Tramiel, Sam Tramiel, Garry Tramiel, new General Manager Greg Pratt, and the Atari regulars including Bob Brodie, Art Morgan, Mel Stevens, Dan MacNamee, J.Patton, Don Thomas, Ceazar Dennis, Diana Goralcyzk (I KNOW I blew that spelling... sorry Diana!), and the new guy, Bill Rhebock. Greg Pratt is younger than I expected, and is very approachable. His enthusiasm for Atari shows in every word... and Greg is no newcomer to Atari, having been head of the Financial division for some years. It looks like he must have reason for optimism. I remain ready to believe. I expect to talk to him at greater length tommorrow.

Yes, Atari looks GOOD at this COMDEX, and has more square footage in the largest hall of the convention than any vendor except JVC. While one developer observed that they wished some of the COMDEX show dollars were going to support the developer and dealer network, in a very real way, they ARE. Here at COMDEX, in the largest computer resellers convention in the world, ATARI is making sure that NO ONE thinks that ATARI is a second class manufacturer. THAT MATTERS, friends. Across the board.

Next report: Fourth Quarter BUNDLES to be announced... !!!

Don't miss the first four sets of VIDI-ST pictures from COMDEX, available online now... from Z*NET, VISIBLY BETTER NEWS COVERAGE!

The main application always gets 0 as its ID. Try to start
it as a DA, and you'll get other values.

> share internal harware connections and cannot be used
> simultaneously.

What good is that? That doesn't make any sense. You can't use your
serial devices and the network at the same time??? Hehe...

>There is no SCSI port on the Mega/STE as on the TT,
> but all the other ports are the same.

That's really too bad. It makes more sense to include an SCSI
port into the box. It seems the standard for the home/small business
machines these days (although IDE seems to be catching on as well).

> A VME bus cart slot is
> accessable through a panel on the back of the machine. Most of the
> MEGA/STE machines here have an additional serial port card installed
> there.

A VME slot on an ST? Now THAT makes sense. It is about time that
the ST has some sort of stadard slot.

>
> The Mega/STe will have a base unit featuring 2 MEG of RAM, a
> switchable 16/8 Mhz acceleration (yes, SPECTRUM compatible) with or

> itself TOS 2.2)

So far so good. Sounds like a decent low-end home unit if the pricing
is right.

>... and will be available "after the first of the
> year" for a price that is to "knock out the Mac Classic". That may
> be UNDER $1200!

HAHAHAHA! I should remind you that Atari said the same things
about the TT when they showed it for the first time (about 2 years ago!).
I would take statements like this with a BIG grain of salt judging
from Atari's previous antics (no pun intended...hehe).

As for being competition for the Mac Classic...It would seem to be
a very good contender IF the pricing is reasonable and IF they get it
out the door before the next ice age.

All the Mega/STe units here on display are hooked to
> the new Phillips 15" color monitors, the STERO SOUND units, model
> SC1435. This is VERY nice, large screen unit that will replace the
> SC1224 monitors completely, and should retail at or just above the

That is interesting. Is it a multisync? What resolutions will it
support?

Cheers,

Chris

3289. Re: inimf and mf

Newsgroup: comp.sys.atari.st
Date: 1990-11-15 14:42:03 UTC
From: Erik-jan.Vens@samba.acs.unc.edu
Message-ID: <1640@beguine.UUCP>
Source record: 237159

Hi there.

First of all, the SLM804 is a write white printer. That's the main point why it doesn't print correct with just any .pk files.

But first. There is a big difference between inimf and virmf (what you call mf). inimf stands for initial mf, and virmf for virgin mf. inimf can do most of the things virmf can do, but it uses a lot of memory to build a fast loadable dump of it's set of macro's. Now virmf can not dump the macros, but it has all the memory to do it's calculations.

Usual invocations:
inimf plain \dump
and:
virmf &plain cmr10

Now for the Atari Laserprinter. I do have some documents on write white printers. There is also a set of macros to add to plain.mf that can take care of the right things to do with a ww printer engine. I can send those if you like. Just yell.

>

I agree completely. Honestly, how many times does an average person
power up and down in a day? It simply isn't worth the hassle of a
ROM based OS to save you a few seconds once or twice a day. Marcelino
brings up another good point that you can always go back to the old
OS if you have to (in case it breaks your favorite software or whatever)
just by reloading it to your hard drive or by using something like
Apple's system switcher. ST users would have to open up their machines
and carefully pry out the TOS1.X ROMs and carefully put the old ones
back in and then re-assemble the machine. A MAJOR pain in the ass if
you ask me.

My friend Tom Hageman, author of a good many UN*X utilities, has also written a good resetable, resizable, configurable RAMdisk. Tom is sort of a guru in our local Atari community and we are thinking about releasing all his programs in the public domain. They already are really, but they are not on the net.

He has also done a port of JOVE (Jonathan's Own Version of Emacs) which in fact should be called TOVE (Tom's...) because it has almost nothing to do with the original JOVE anymore. Sourcewise that is. It is completely bugfree, well improved and runs on Atari ST, MSDOS, UNIX (diff.t flavours).

Anyway, since the RAM disk topic came up, I could as well submit his RAMRESIZ for release on the net. I do seem to remember that comp.binaries.atari.st is a moderated newsgroup. Can anyone tell me how to submit?

>

As the author of the program I would like to comment on this. I am really
looking for a suitable compression algorithm. I want an algorithm which
is fast as has acceptable compression ratios.

If anybody on the net has such a piece of software please send it to me.

I had a complaint about the software not running on a Mega ST with a 19
inch screen. I looked in the software and found a bug. If allocate
32K of memory for the screen toggle option in Bfront. This is not enough
for a 19 inch screen. Does anybody know the correct method of determining
the proper amount of memory to be allocated?

3295. Mac Classic and IICi

Newsgroup: comp.sys.atari.st
Date: 1990-11-15 16:05:16 UTC
From: psurge@cs.utexas.edu
Message-ID: <14684@cs.utexas.edu>
Source record: 237165

I saw an add in our local University Liberal Rag (read:student newspaper) for the Mac Classic and Mac ci (or whatever it is called, might be the si). Anyway the new lower prices were this:

Classic:
~1400 new with 2 megs and hard drive
~900 with trade in of mac equipment: Plus or 512E must not be cracked or have any engraving, keyboard and mouse, manuals, ORIGINAL system disk

Si:
~3000 new
~2000 with trade in, I don't remember the model, but same restrictions apply also with trade in of mac printer or Ibm printer with all cables and knobs and same casing restrictions, oh and manuals too.

I don't know about original boxes being needed, but it would seem like they would want them anyway.

Keep in mind I am doing this from memory, the prices might not be exact, I was just trying to remember the first digits of the price.

Also, all equipment was subject to approval of acceptence by the dealer, which means the above equipment could be rejected for any reason and you will have to pay full price.

Note that this cuts out many of the new computer buyers who do not have mac equipment just sitting around waiting to be traded. Hence Apple's new lower prices will probably not even entice most people. (who would want to give up their computer to buy another one when they can get a whole new system for less and keep their old one also!)

3296. spslidex

Newsgroup: comp.sys.atari.st
Date: 1990-11-15 16:45:14 UTC
From: depeche@quiche.cs.mcgill.ca
Message-ID: <38@bart.cs.mcgill.ca>
Source record: 237166

Greetings, all. I was wondering - I have a program called spslidex which can view .spc, .spu. and .sps files. These are 'pseudo' 512-colour images in low-resolution.

BGIF creates .spu files which always take 51k but I know that many of them can be compressed. Ideally I would like to compress them to .spc, since that seems to be standard, but .sps is okay too, since it is a bit more compact.

Well, I have NO IDEA how to convert them to .SPC, and spslidex doesn't do too good of a job converting to .SPS, as I usually end up getting 'blotches' of black all over the picture, after the conversion, and converting it back to .spu still leaves the blotches in the picture!!!

I should say that spslidex works great converting from .spc to .sps, but it hasn't worked ONCE for me converting from .spu to .sps

Is there a newer version of spslidex out there? or a different program which does the conversion?

>Hmm, that's still nearly two months. Don't you really do a daily or at
>least weekly backup?

I'm getting sick of all these complaints. I'll explain one more time...

The Atari ST is not a "supported" machine at the University of Michigan.
Atari.archive.umich.edu is not our machine. We have no input on the backup
schedule. We are permitted to use the machine on the whim of the system
administrator. The Atari Posse consists of volunteers who run the archive
in their spare time. Despite all of that, we still manage to run one of the
best Atari archives in the world.

You want better service? Give us a machine and some funding.

Bottom line: If you don't like our archive, don't use it. We don't need you.

The last time I checked in the U of M bookstore I could get a MacClassic with 1 meg Ram and an internal disk drive (high density) for $750. A MacClassic with 2 meg of RAM and 1 internal high density drive and a 40 meg internal hard disk was only $1150. This included the keyboard and the usual built in mono monitor.

I'm not sure where you go to school but they sure are taking you to the cleaners.

>| Michael Fischer <fischer-michael@cs.yale.edu> |

I've used the Vault, and I agree, it does these things nicely. My main
complaint with the Vault is that it uses TOS format to backup the files,
so speed suffers. Yes, I know of the relative advantages and disadvantages
of TOS format versus direct track writes in proprietary format...I'm
ultimately looking for a backup program that works as well and fast as
PC-Tools, though I understand that the ST's drive controller chip doesn't
easily allow for format+write in the same pass, nor for automatic detection
of floppy inserted...

3301. GNUC + cs.uni-sb.de

Newsgroup: comp.sys.atari.st
Date: 1990-11-15 18:06:40 UTC
From: gjh@hplb.hpl.hp.com
Message-ID: <GJH.90Nov15180640@ghiggins.hpl.hp.com>
Source record: 237171

I have *exactly* Dave Megginson's problem too (not, not *that* one :-)).

With $TMPDIR set to e:\, gcc reported ...

gcc e:/cc100000.cpp : cannot find file

So, I thought I'd try the cs.uni-sb.de version (yes, I *will* post it to atari.archive, but I'm temporarily, denied ftp access, so you'll just *have* to wait). On with the plot --- I tried the cs.uni-sb.de version --- Crashed and burned. However, the cs.uni-sb.de version of GNU C was posted there by Edgar Roeder (with whom I am e-corresponding). I happen to know that Edgar is a bash user --- bash allows you to use / as well as \. Soooo, I got bash and turned on the / option --- Crashed & burned *again* --- and yes, I tried it with without the / option ... surprise, Crashed & burned!. No matter *what* I set $TMPDIR to, gcc reports that it cannot find $TMPDIR/cc100000.cpp (and yes, I made sure that $TMP matched $TMPDIR, just in case).

```
export TMPDIR=/tmp
echo $TMPDIR
/tmp
gcc -v -o test test.c
```

gcc: /tmp/cc1000000.cpp cannot find file.

```
export TMPDIR=/gnu/tmp
echo $TMPDIR
/gnu/tmp
gcc -v -o test test.c
```

gcc: /gnu/tmp/cc1000000.cpp cannot find file.

That's two different versions of GCC giving *exactly* the same problem under two different environments. Anyone any ideas? Edgar's suggestions involve looking deep into the execution process using SysMon or master --- I have neither at the moment.

Graham (*still* puzzled) Higgins.

Just a short note to let you all know that we are now accepting orders for MT C-Shell and VSH Version 2.0. There's lot's of new features and it's more robust, it's faster, and TT compatible.

The new VSH has individual window options (sliders, fonts, etc.), cut & patse between windows, save window contents to a file, and much more. VSH also lets you install custom icons onto the VSH desktop for your favorite programs.

If you would like more information, I can send it you as e-mail.

Thanks.

3304. Cartridge Tape Drive and tar

Newsgroup: comp.sys.atari.st
Date: 1990-11-15 19:19:39 UTC
From: paulm@ccicpg.UUCP
Message-ID: <3588@ccicpg.UUCP>
Source record: 237174

I wrote a cartridge tape driver which is installable from device 0 - 6.
This driver works via trap #13 calls. I am using it with what I believe
is an interface board from an SH204 ? disk subsystem. It works with a
Cypher 504 drive with a SCSI interface. To go with this is a tar program
that reads and writes UNIX compatible tar tapes for creation and extraction.
The driver is written in Alcyon assembly (sozobon compatible) and gets it's
device number from the file name. The name can be tapedvr0.prg
tapedvr6.prg.

The 'tar' program is in MWC 'C' and works from either a shell or from desktop
if named tar.ttp.

There is a tapeio.h 'C' binding file for tape IO.

The source and binaries for both are available to anyone who can hack a tape
system together and requests me to E-mail the code to them.

I too have had problems with every version of gcc137 that I have gotten
my hands on!! Could someone who has successfully run gcc137 under TOS please
E-Mail me so I can talk to them??

longj@lonex.radc.af.mil

>is to a boot sector virus. It's true though, that there probably won't be
>many link viruses infesting command.com, cause there's no command.com.

Yes, I ALWAYS power up with a disk in Drive A. It is my own "standard drive holder disk" :-) which is guaranteed to not have a virus on it. And with a disk in A, I boot from the hard disk MUCH MUCH faster! Try it - you will like it!

>Up to now, I haven't been hit by viruses (viri ? Argh, not again. :-)
>even though I use PCs with disk based OSes and STs with ROM based OSes,
>so in my opinion the danger is exaggerated.

I have been hit by a virus on a COMMERCIALLY PURCHASED UPGRADE DISK from the ORIGINAL MANUFACTURER. The danger is NOT exaggerated and I don't EVER boot with anything other than my own "clean" disk in the floppy drive.

>So much for safety arguments.

You may not care about your programs/data, but I do and my operational methods increase the probability that I will not get "hit" again. You know what the FRAM Oil Man says !!!!! :-)

>Bye bye data,

Hellloooo safety,

[rehash of previous paragraph deleted]

Honestly, is there any reason why you posted your message. I deleted your part simply because it was the same as the previous. And just to put my $.02 in, ROM based OSes have many merits. First of all, the STs with ROM based TOS can also run disk based versions of the same thing. Perhaps atari could be nice enough release old TOS versions on disk. I had a friend who fried his TOS ROMs (I don't know how) and he was still ale to use his computer by using a disk-based TOS. As for the how many times a day do you turn on or off your system: **News Flash** Not everyone has a hard drive!! Rebooting is very standard for people with floppy drives. Also, if you were to reload the
"old" system on your Macs, I am sure you would reinstall it on the hard drive. That would involve first digging out the old disk (assuming you still have it) and then going through the install process. I could personally reinstall the old ROMs in about ten minutes, about the same time I am sure it would take you to restore your old software OS. I don't see any advantages in that.

In article <1744@mwca.UUCP> bill@mwca.UUCP (Bill Sheppard) writes:
>I've used the Vault, and I agree, it does these things nicely. My main
>complaint with the Vault is that it uses TOS format to backup the files,
>so speed suffers.

Speed may suffer in the Vault for a variety of reasons, but the use of TOS format isn't generally a major one. The Vault uses a sophisticated caching scheme so that the floppy disk is written out in a few large multi-track blocks. Directories are created in memory and written to disk only once. The FAT is written only at the end. Data sectors are written in large blocks. The effect is similar to that of Turtle where an image of an entire disk is created in memory and then dumped to floppy, but unlike Turtle, the Vault can work with less memory than the size of a floppy.

The only place where TOS format really hurts is with really small files, for every file and every directory takes at least one cluster = two sectors on disk.

Where the Vault spends a lot of time is in getting the files off the hard disk. It just uses straight Gemdos calls for that task, and TOS doesn't allow for simultaneous I/O to the hard disk and the floppy.

One way to speed up floppy disk writes is to turn off write verify. If you value your data, this is a bad idea, and if you don't, then why are you bothering with a backup anyway? Of course, sophisticated data compression using error correcting codes might make this unnecessary and allow for faster backups, but getting significantly greater speed than the Vault provides isn't so easy.

Try copying a large folder from hard disk to floppy using the desktop and then try it again using the Vault. You will see that the Vault is much faster.

From: dh@tardis.cs.ed.ac.uk
Message-ID: <sent.Thu.Nov.15.22
Source record: 237180

Thanks to everyone who mailed me about znet...sorry for not replying to everyone but I'm not completely sure how to mail to USA yet. I'll find out soon.

Anyway...I am hoping to get some hot news from Comdex from znet. I saaw that someone posted a daily update from comdex produced by znet to here yesterday. I was wondering if it was possible for anyone to mail me all of the znet daily updatees from comdex as I can't find them on any ftp sites. If you know an ftp site that keeps znet online (apart from atari.archive) then please tell me. Atari.archive doesn't seem to get it's znet very quickly.

I presume that these daily comdex updates are available on the znet BBS, but being based in the UK, a phone call to USA BBS is not really feasible.

Also, a post of this week's comdex znet (published fri 16th) would also be appreciated.

Anyone that helps me out here will have praise heaped on them by me <grin>.

Thanks very much
Richard Imlach

>> simultaneously.

>What good is that? That doesn't make any sense. You can't use your
>serial devices and the network at the same time??? Hehe...

Just like a real Mac. Blech. One Zilog 8530 doing double-duty. Oh well,
I wonder if it's good or bad that they attach two different connectors to
the same port. On the Mac there's only one connector on that port, the
"printer" port that has to do double duty as the Localtalk port.
It's still a step up, though, just to have the 2nd serial port. Being able
to plug into Phonenet/Localtalk will be very convenient...

>>There is no SCSI port on the Mega/STE as on the TT,
>> but all the other ports are the same.

>That's really too bad. It makes more sense to include an SCSI
>port into the box. It seems the standard for the home/small business
>machines these days (although IDE seems to be catching on as well).

IDE? Isn't that just a new name for the Same-Old Same Old, XT/AT bus-specific
cards and such? Oh well. Yes, a full SCSI port would have been nicer. Oh well,
there's always Supra, ICD, and BMS.

>> A VME bus cart slot is

>> itself TOS 2.2)

>So far so good. Sounds like a decent low-end home unit if the pricing
>is right.

Hm... TOS 2.2? Well, if it's at all like the new TOS versions, that means
it's 68030 compatible, right? Oh boy... I wonder if the memory controller
is any faster, so you can use faster DRAMs. RAM caches are nice, but don't
yield such a big win when a lot of interrupt processing is going on.

>>... and will be available "after the first of the
>> year" for a price that is to "knock out the Mac Classic". That may
>> be UNDER $1200!

>from Atari's previous antics (no pun intended...hehe).

Who knows. I think Atari has done a good job of keeping things under their
hat 'till they're really ready to be announced. This may be for real, eh?
(I suppose it's no longer a breach of non-disclosure to say that the MegaSTe
had been mentioned several months ago, and that Atari solicited suggestions
from their developers for what features the machine should have? Yep, looks
like a good job so far...)

>As for being competition for the Mac Classic...It would seem to be
>a very good contender IF the pricing is reasonable and IF they get it
>out the door before the next ice age.

Got my fingers crossed. Of course, it figures this machine would be released
just after I ordered a 1040 STe.

> All the Mega/STe units here on display are hooked to
>> the new Phillips 15" color monitors, the STERO SOUND units, model
>> SC1435. This is VERY nice, large screen unit that will replace the
>> SC1224 monitors completely, and should retail at or just above the
>> current color monitor price. It IS a step UP.

>That is interesting. Is it a multisync? What resolutions will it
>support?

Echo that question. A 15" color monitor will probably look real sharp, but
it'd also look kinda stupid showing the same ol' 640x200 screen. It sounds
a lot more impressive than the 1425(?) that was described in the old developers
docs (for the "EST" 'way back then), but probably a direct descendent. That
would mean a 35 khz horizontal scan rate. Oughta be capable of 1024x768 rez...

3316. about to buy - Stacy & music

Newsgroup: comp.sys.atari.st
Date: 1990-11-15 23:50:56 UTC
From: mjs@hpfcso.HP.COM
Message-ID: <7340031@hpfcso.HP.COM>
Source record: 237186

I am about to purchase a Stacy for use use with some music projects of mine. After diligently searching through the old notes here, and talking to people at our local users group, there are still a few questions I haven't gotten straight answers for:

1. Spectre GCR and midi. Conventional wisdom is that the ST midi port is not recognized in Mac mode, but there may be ways around this. I am not sure I will need this to work, but it would be nice.

2. Laserjet output from music typesetting software. Several of the available packages (Notator, EZ Score) don't support it, although I have seen EZ Score's dot matrix output and it is pretty darn good. I've heard of a PD package "laserbrain" that acts as a laser printer driver to some extent. Does this actually work, does it support Laserjets (no Postscript) and does it do any "rounding" to make the output look better than on a dot matrix? Pointers to music typesetting packages that *do* support Laserjets would be appreciated, too. I know about Dr. T Professional & DTP, and of course there is always the Spectre / Postsript cartridge option.

3. Can you use an accelerator in the Stacy?

4. What about this rumored third party battery pack?

5. Anything else I should know?

Responses by mail will be summarized and posted.

From: rrwood@contact.uucp
Message-ID: <1990Nov16.003735.14049@contact.uucp>
Source record: 237187

Someone posted an ad for used ST equipment and made mention of "a Supra Hard Drive Interface" and a Seagate hard drive. From this I infer that Supra markets an interface that allows one to use a nice cheap IBM style hard-drive on one's ST. Is this correct? And if it is so cheap to get set up with the interface and drive, why would anyone choose anything else for his or her ST?

-Roy Wood.

did you try setting the following environment variable:

UNIXMODE=/.,LAHbdxrC

The final character is your root directory. This example assumes it is drive C. For more info on the subject, I would usually refer you to cs.uni-sb.de, but since this archive is unavailable at the moment, I'll try to break it down from memory. The first slash indicates slashes are used as well as backslashes. The character following the dot is used to replace multiple dots in the filename. L indicates the use of symbolic links, and A enables automatic links. These are simulated, and the link information is hidden in a table in a file called .dir, which is created automatically by all UNIXMODE applications. This file is also used for long filenames, which are implemented as simulated links.

H causes .dir to be completely hidden from ls. b, d & x escape me at this late hour. The capital letter following r indicates the root drive.

The programs you got from cs.uni-sb.de all use UNIXMODE. The environment is very useful for porting Unix source code. Recently, I re-ported Elvis, using the libs from cs.uni-sb.de, and now it understands the long file names and links. Also, I was able to define the system type as BSD, rather than TOS, which took out everything from the original port, and allowed it to use termcap. OK, I had to keep their sync() clone, but that was all.

Hope this helps.

Doug

Overall, the Microsoft Mouse conversion projects are a raw deal in my opinion. First, you have to find a DB-9 connector that will plug into the ST port (look and see what I mean) then you have to cut the cable.

Besides, there's a mouse rennaissance going on. Something called the Golden Image mouse is supposedly a MS repackaged. There is one based on the Genius Mouse (Yechh) another on the Amiga's (yechh) the infrared cordless from Practical Solns. (yayy) and one from Logitech (yesssss). Generally, they are all $60 or less, except the cordless.

One solution to the problem of fitting DB-9's with large housings into the ST is to go to your local electronics store (Radio Shack, for example) and buy a joystick extension cord. Plug one end into the mouse port, and then plug the fat connector into the other end. Make sure the cable you get has all 9 pins connected (the Radio Shack one does.) This also makes it easier to connect/disconnect the mouse and joysticks.

Newsgroup: comp.sys.atari.st
Date: 1990-11-16 10:43:18 UTC
From: jamie@defoe.enet.dec.com
Message-ID: <1990Nov16.103831@defoe.enet.dec.com>
Source record: 237192

Keywords:
I'm a fairly isolated ST user in the UK, who wants to converse with other ST users through
Email or Snailmail with view to swapping software, working on midnight hacks etc.

Anyone interested, send me an Email ASAP!

Cheers,

Jamie.

3323. The x-control panel - a plea

Newsgroup: comp.sys.atari.st
Date: 1990-11-16 11:30:55 UTC
From: jeroen@pluto.phil.ruu.nl
Message-ID: <954@accucx.cc.ruu.nl>
Source record: 237193

I've just finished reading a mag stating the TT's x-control panel
actually runs fine on an ordinary ST.

So, people@atari.uucp (Ken B., Ken S., Allan, Derek etc): I think
it would be in the in the best interest to Atari, ST users AND TT
users if this thing got around.
It looks like the Atari programmers did a real nice job. Why not
make this effort worthwile and cut us loyal ST-users and programmers
in too?

ST compatibility means the world of ST programmers can create
nice XPD's (is that what the're called, X-panel devices?) if
only the x-cp and the documentation on creating modules for
it comes widely available.

I like the idea of modular machine configuration accs - I like
it on my Macs, and think it would help my ST too.

Let's all make this thing work, people; you guys from Atari,
please give us the opportunity to do so.

Greetings, Jeroen (jeroen@phil.ruu.nl)

Query: I notice that in your examples, there are 9 characters before the '.cpp' tag on the file. TOS allows 8 characters. How does your CLI deal with more than 8 characters in the first part of the file name? At least one CLI I've come across truncates the 9th character. Others might turn the file into something like 'cc100000.0cp.

++ did you try setting the following environment variable:

++ UNIXMODE=/.,LAHbdxrC

Yes, UNIXMODE *is* correctly set (according to Edgar's documentation) I even reformatted my HD in order to move to 32Mb partitions, so I could get GCC on the root partition. What I don't understand is how come *whichever* GCC I use, with *whichever* cli, gives the same problem. Apparently Dave Megginson *did* have the same problem, but it went away of its own accord. Wierd.

3329. REPORT: Spectre survives drop test

Newsgroup: comp.sys.atari.st
Date: 1990-11-16 16:28:37 UTC
From: rrd@hpfcso.HP.COM
Message-ID: <7340033@hpfcso.HP.COM>
Source record: 237199

Last Wednesday, at our User's Group meeting, one of our members was demonstrating his STacy (yes, it's nice). We had my Spectre GCR hooked up to it to duplicate GBSmall's cute demo of a cheap Portable Mac (yes, that was nice, too).

When we were putting things away, I wasn't paying attention to what I was doing, and I picked up the Spectre by the disk drive cable. The box didn't like dangling from the cable, so it took a dive. When it hit the floor (1.3 metres below), the case separated, just as it was designed to do, and the 3 parts went their separate ways ("KE-RASH"!).

Everybody stared at the mess, and I tried to nonchalantly pick up the pieces and assure everyone that it still worked.

When I got home, the first thing I did was examine the thing for damage. The PC board and all its components looked intact, and the two halves of the case were undamaged (not even a scratch!). I put it all back together and plugged it into my ST. I had all my fingers and toes crossed as I booted up the ST and started Spectre.

IT RAN PERFECTLY. The ROMs were still intact and everything.

Okay, so this is only one data point, but my opinion of Gadgets By Small has just gone up a HUGE amount. I reported my findings to another member of the User's Group, and he said that he has accidentally dropped his, twice. Still works. He likens the quality to that of HP calculators. I (humbly) agree.

3333. WordUp 3.0 printer drivers 8/20/90 - EABCO SALE!

Newsgroup: comp.sys.atari.st
Date: 1990-11-16 18:38:11 UTC
From: pegram@kira.UUCP
Message-ID: <1990Nov16.183811.5708@uvm.edu>
Source record: 237203

MY REQUEST:
Does anyone have the 8/20/90 update of disk 5 of WordUp 3.0? I have the rest of the update, (disk 1) but my disk 5 got sent back from Louisiana (*not* Camarillo CA!) with my old drivers on it. If the upgrade is still on Genie, tell me where, I might have to join (or pay one of my friends to download it 8-). I would prefer it if someone could uuencode it and email it to me though. If you're worried about sending it, remember, it's ARCed with encription, (I checked, I hate the install program) - so I couldn't rip off poor (defunct??) Neocept if I wanted to, and nobody wants *just* printer drivers do they???

OTHER INFO:
On a related note, E.Arthur Brown Co. sent me my Spectre GCR and a new flier. They can now sell Ataris by mail order. They also have closeouts of many Michtron products - also defunct now? I heard that Michtron's phone is disconnected, didn't try it myself. Three items stick in mind: Fleet Street Publisher 3.0 (funky, but includes built in UltraScript postscript emulation and support) for $70 and MasterCAD 3D (sp?) for $30, also Tempus (probably v2.07) for $20 to $30. EABCO is in Alexandria, Minnesota U.S.A., and will ship overseas (I checked once 8-). I'm not too sorry that I don't have their phone and address with me - I need to get in my order! Email me if you really can't find their address and phone.

Happy close-outing - now you know why I finally got a GCR (the death of U.S. ST software firms + the Apple ROM scare 8-) I do hope that increased importation by dealers, rather than big distributors like Michtron was, will actually improve matters. You can buy Lattice C 5.06 and Turbo C (ST) from Joppa Computers in Maryland _now_. That's how I finally upgraded to an optimising ANSI C compiler (Lattice - cheaper and in English, supposed to be fast too! 8-).

ATARI 1040ST HARDWARE and SOFTWARE PACKAGE FOR SALE

piece-price
1040 ST with Joystick and internal $450
battery-backed-up clock
SC1224 Color Monitor $175
IB Drives external 5.25" 360K floppy drive $150
all cables, documentation and packaging included
----
total piece-price: $775
<><><>
Entire system price: $700

If you buy the entire system, I'll toss in, at no extra charge,
commercial programs including Wordprocessing, Drawing, Games
and "Printout" software -- I'll be happy to send details on
request. In addition, I also have about 50-60 3.5" 720K Floppies,
and something like 20 5.25" 360K floppies. Some are empty, some
filled with freeware and shareware. I'll include these too if
you buy the whole system.

I also have an Okidata Microline 92 printer with the Plug-and-Play
(IBM/EPSON-compatibility) ROM package and the High-speed Serial
Port Option -- either or both can be installed or not at your
choice. I'd like $100.00 for it, but that's negotiable too.

Please don't be too shy to email your offers for all or part
to me at 'gaz@apollo.hp.com'. Everything is negotiable.

>>Last month my original Atari mouse died (after three years intensive use),
>>and I have to replace it.
>>Is it possible to connect a MicroSoft mouse? What additional hardware
>>(and software ?) do I need?
>>I own a 1040ST / TOS 1.4.

It's really easy to modify a Microsoft InPort mouse to work with the ST. Been working fine for me for about a year now. I don't have the directions on me, but send some mail, and I'll figure out how I did it and send the directions... All you need is a DB-9 and a soldering iron, no drivers necessary.

Mike

3336. Various Programming Problems

Newsgroup: comp.sys.atari.st
Date: 1990-11-16 19:33:57 UTC
From: jimomura@lsuc.on.ca
Message-ID: <1990Nov16.193357.3463@lsuc.on.ca>
Source record: 237206

AES Support:

First, my thanks to all who responded about this matter.
The information I have is that I should try to get Ian
Lepore's 'gemfast13.arc' file which is a complete AES support
kit. I should be able to get this from the 'atari.archive'.
I have a domain address for that site, but can someone give
me a "bang address" for whomever is in charge of maintaining
the archive so I can request it? I don't have FTP capabilities
to my "local" site and I can't do it through my Net connection
site for other reasons.

Mouse Report Range Settings:

In the program I'm working on, I'm starting at Medium
Res. and then switching to Low Res. The only problem I have
is that I want the Mouse to limit its travel to 320 in the X
range. First I tried to use 'initmous()' and that didn't
work. I'd like to figure out that one eventually, but it should
not be necessary for this project. There should be an alternative
using 'ikbdws()'. But I can't get this to work either.
The following is a model of the code that I tried:

```
char scratch[5];

scratch[0] = 0x09; /* Command to start absolute mouse reports */
scratch[1] = 319 >> 8;
scratch[2] = 319 & 0xff;
scratch[3] = 0;
scratch[4] = 199;

ikbdws(4,scratch);
```

When I ran code essentially the same as the above, the
mouse seemed to stop sending X Y information completely. Any
ideas about this?

>November 1990). Both have had programming articles related to the blitter chip
>and demo some of the supposed advantages of the chip.
>David Paschall-Zimbel davidli@simvax.labmed.umn.edu

I can add a little to this (since I wrote those articles... 8^))
The blitter chip offers a noticable speedup on most graphics operations
like text output. The software blitters offer a huge speedup of many
operations, but the last time I tried them (admittedly about a year ago)
they still had enough little incompatibilities that I would not use them
full time. They really made some things (like emacs) super fast and nice
to use, though.

Curiously, the one operation that the software blitters didn't speed up
(in the last versions I saw) was the true blit, the vro_copyfm() function.
For things like this, the blitter chip offers better performance than you
can get from pure assembly language, something like a sixfold performance
increase.

For the best of both worlds, you use both software and hardware blitters,
and your system absolutely screams. (I'd assume that the latest software
blitters fix the little nits that used to bug me)

On a side note, I ported BoinkOut, the blitter game in November STart,
to the NeXT cube, and it runs about the same speed on a 25MHz 68030 as
it runs on a Mega ST with a blitter chip. The comparison is not totally
fair, because my cube is running a lot of other tasks (all graphics are
done by a separate window server process, so there's a _lot_ of inter-
process communication) and the NeXT runs a 256Kbyte screen and uses
floating point instead of integers... Technology buys you a lot, but it
doesn't always buy you speed.

cheers,
-sam (sam_s@NeXT.com)

3338. GCC V1.37.1 Lives (and Thanks to many!!)

Newsgroup: comp.sys.atari.st
Date: 1990-11-16 21:15:58 UTC
From: longj@lonex.radc.af.mil
Message-ID: <1990Nov16.211558.14374@lonex.radc.af.mil>
Source record: 237208

I finally got GCC v1.37.1 working here at work!! It sure went through some tricky code that I thought I was going to spent several days debugging very easily!! Only a few minor changes and complied all the stuff I wanted!! This, combined with the gnumake facility, gulam, and gdb, have made true belivers of my fellow engineers here at work, no more "game machine" cracks!

Thanks to Doug Stailey, Roy Bixler and David Mak for responding to my pleas for help!! It turned out to be a combination of several problems (isn't it always??).....I had several corrupted files that took many transfers from host to ST to get correctly, some which didn't survive well on the first attempts. The UNIXMODE trick mentioned by Doug S. seemed to have helped also.

NOW THAT I HAVE BUTTERED EVERYONE UP......

I have a program that uses a lot of VDI screen routines. After compiling it up, I still can't get the linker to resolve the following symbols:
v_curhome v_curdown v_enter_cur v_exit_cur

Are these not in the gem.olb ?? I had several other vdi calls that were unrecognized until I remembered to link in the gem.olb, but these four remained?

Any suggestions??

3339. DeskJet ink cartridge problem -- blow

Newsgroup: comp.sys.atari.st
Date: 1990-11-16 21:54:00 UTC
From: logajan@ns.network.com
Message-ID: <1990Nov16.215400.4544@ns.network.com>
Source record: 237209

The other day, my several times refilled ink cartridge stopped working.
I filled it up some more, but that was apparently not the problem.

So I held my finger over the "extra" hole I had burned in it for refilling,
and I blew into the top hole (in the green plastic part) pressurizing
the internal ink supply (I held the printhead downward.)

This fixed the problem, and I haven't had a recurrance in the last
month or so.

Don't you know that Atari will never die, just hemhorrage forever?
Seriously though, if they don't do some *SERIOUS* marketing of their new stuff, they may actually die. Amigas are advertised all over the place, constantly, in non-computer publications etc., but it's a big deal when Atari places one single ad. I mean, I've seen their ads for the Lynx and Portfolio, good products both, but an STe/TT ad? Nada.

BTW, disk copying with TOS 1.0 is best done with a ramdisk. Also, you can do a *LOT* of things with the Mac desktop that you can't do on an ST, a good example being placing files/folders on the desktop... a fundamental thing, to me.

Get a Spectre GCR-- the ultimate alternative desktop for the ST.

STeve, however, is a vibrant, living, and still powerful machine.
For STeve without the monitor: $300 (1040ST main unit w/mouse)

I'd just venture to say that over 90% of those who are selling their
STs are upgrading to the STe.

I need a database program to keep records of my constantly growing collection of GIF and SPECTRUM picture files. I would like to have the following fields in each record:

-Gif Filename
-Gif type (person, place, thing, other)
-Disk the GIF is on
-A brief description

If you know of a program which fits this description, could you please let me know its filename? If you could tell me that the file is either on Panarthea or Terminator then I will gladly get them myself; however if it is a file not available on either P or T I would appreciate getting a copy for myself. I would then submit it to Panarthea or Terminator so that others may enjoy it as well.

(Note: I got a program called 1st_base. It's a pretty good data base, but when it draws the boxes around the fields it gets all screwed up. Does anyone have a version of 1st_base which is in good working order???)

>Yeah! It's there, and it is a demo of the new TT TOS. Go on and try...
^^^^

It always amazes me how people try to rationalize piracy by convincing themselves that they are in fact using a demo. Pirates strike again!
The same guys who rationalize their unwillingness to pay for shareware by convincing themselves that shareware is equivalent to public domain.

If it is the same "demo of the new TT TOS" that is circulating around here in Seattle, then what you have isn't really even a complete TOS. It only replaces the desktop and no other functions (GEM, etc). From the file size shown above, that would seem to be a correct assumption.

Don't bother wasting your time downloading "demo of the new TT TOS". It is not a demo. It is not intended for public distribution. It is not legal. It is highly unstable. What purpose does it serve to be distributing and obvious pre-release version of a piece of software, since it only wastes people's time, and will only start inaccurate rumors of the new TOS being unstable, which it (the real one) is not.

> don't hesitate to correct me.
>
>>[...]
>

This is true to an extent.... There is no *LEGAL* way of changing GEM's knowledge of its environment but this is not to say it can't be done. Swapping all the appropriate data in Gems DATA and BSS segments will acheive results. (I have done this) but it is time consuming and not very robust :-)

How to find the data ? simple boot up in low res save the first 40k of mem boot up in medium do the same.

diff the two files

Unfortunately, gem changes more than the res when you do this but it does narrow down the field.

A few things to think about :-

DA's dont like this, few DAs check the current rez and rescale their resources (Probably only mine :-) thus da's displays may exceed the screen size

AUTO progs likewise though these don't know about regular res changes either

In the January 1990 issue of ST Informer there was an article about a program called the Digitizer Machine made by Basicware Software. The company's phone and address was given (in Huntsville, TX), but when I called the phone number the other day, I got an answer from someone at a private residence who had no idea what I was talking about.
Does anyone know if the software exists or if the company exists? If the company does exist, could someone supply me with the address and/or phone number? Thanks.

>interface and drive, why would anyone choose anything else for his or her ST?
>
>-Roy Wood.

Why wouldn't anyone want to buy an interface and use a standard hard disk?
Is that your question?

Here's my answer...

A Supra hard drive interface costs $100, if you can still get one. There is
a better product out now (I should know, I bought the Supra) from ICD, and it's
about $130 mail order. This is called a HOST ADAPTER. Everything is an
interface these days, so let's keep things clear.

The Host Adapter plugs into the ST's DMA port (one of the very wise parts of
an ST) and converts these signals to be SCSI compatible. You can have up to
10 DMA devices, and data rates have the potential to be 2 Megs per second
through this port. Fast!

Okay, so that's a start. You mentioned cheap IBM-PC style drives. But now we
only have SCSI compatibility. Whoops! So you need to convert from SCSI to
ST-412/506 now, if you want to use an off-the-shelf MFM or RLL-encoded PC type
hard disk. What now?

Well, the best and easiest choice is to get an SCSI compatible drive instead.
This costs $30-$150 more than an equivalent ST-412/506 hard disk. The other
choice is to buy a second "adapter", which converts from SCSI to ST-412/506.
These come in both MFM and RLL flavors, and Adaptec is a good choice. They
sell them for about $130, depending on the model. It will let you connect
TWO cheap PC-type hard disks with one board. An extra savings...

But now you need a hard disk, and hopefully one that's supported by the Supra
or ICD formatting software. Otherwise you need a lot of specific information
about your disks. And you need a box. And you need a power supply. And you
need cabling. And you need the luck of the Irish, because if just one of all
those connections you made is flaky, it is a long, arduous trail. It takes
very sophisticated equipment to debug a hard disk setup -- or lots of trial and
error.

If you approach the chore correctly, you can do all this, save $50 - $200 over
the cost of a mail-order ready made hard drive, and have a dependable machine.

If, say, you get a bad part in the mail (which one) it is sheer hell. I went through all of this about two years ago, and wound up with a 65 Meg hard disk after six months of struggle. Not only did I get a bad hard disk, I got a bad Adaptek SCSI-RLL adapter!

I'd still do it again, rather than buy a new setup. It has run without fail since then, and I need more space now.

I have Uniterm, and do use it on occasion, but my real favorite is Flash 1.6. It is not as snazzy, but has some features that I like. I especially like the way one can switch between the capture buffer/editor and the terminal screen with a single mouse click. The find string function (in the capture buffer) allows me to locate obscure stuff that I did quickly ("Hmmm, did I really delete that file??"). Thus, every session has a complete log that I can search through either by string or by GEM slider bar. It does not support Kermit (it has Xmodem and ascii u/dloads), but there is an desktop accessory that provides this. My only annoyance is that when on a mono monitor, underlined text looks great UNLESS you are using TurboST (it does not come out as underlined at all under Turbo). This program would benefit a lot from the faster screen routines in Turbo (in the GEM editor/capture screen), but I need my underlines!!! This was discovered on a friends system, and is the reason why I have not invested in TurboST (I believe the version was 1.6). Does anyone know if the newer version has this same problem with Flash? What about QuickST? I would buy one of these programs if Flash would work correctly with it. I keep Uniterm around for two big reasons: Kermit and itty bitty fonts (which I sometimes need). For the daily grind however, I prefer Flash.

3354. MiNT library patchlevel 4

Newsgroup: comp.sys.atari.st
Date: 1990-11-17 05:27:58 UTC
From: 7103_2622@uwovax.uwo.ca
Message-ID: <7810.2744840f@uwovax.uwo.ca>
Source record: 237224

Patchlevel 4 of the MiNT library (for the gcc) is now available at atari.archive.umich.edu (check the directory atari/newitems). There are two files:
mntlib4.zoo: source code for gnu*.olb, and all include files
mntolb4.zoo: compiled .olb files (including curses, pml, and gem) plus all include files

The latter file is provided for the benefit of those who had trouble compiling patchlevel 3. It also provides an alternative for those getting the gcc for the first time; all the necessary libraries are here in one package.

There are a number of bugfixes in patchlevel 4 (including fixing the infamous 16 bit malloc bug), some new functions (fopenp and tfork), and some attempts to make the code a bit more in line with ANSI C and POSIX.

I just tried to replace my Chinon SS drive in my SF354 with a Toshiba DD drive.
I have to twist the ribbon cable to get it oriented correctly. It spun and the led lit red. But I got the drive not repsonding alert box. I tried desktop format, and _immediately_ got the disk is write protected alert.
I saw no jumper that I could identify as such on the circut board in the SF354. What am I missing? What do I need to do to get it to work?
Also, can I just get a 34 pin ribbon cable with the approprate connectors to fit the mirror-imaged port locations on the Toshiba? Where would I get such? What would I call it to the salesperson?

Thank you!

>know what the FRAM Oil Man says !!!!! :-)

Perhaps I didn't make myself quite clear: Of course I care about safety of my data. Therefore I make regular backups of my HD. I use virus checkers all the time. I also use a CLEAN disk in drive A to boot the machine because it's faster that way.

And there we are, back at the original issue: a ROM based OS is no safer against infection than a disk based one, and that's all I said to start this side issue. It MIGHT be safer if it didn't start up faster with a disk in drive A: and if it didn't have executable bootsectors but since it does, your valuable SW can just as easily fall prey to viri as on a disk based OS if you're not careful.

The original argument that a ROM based OS cannot be infected is right. But it doesn't lead us anywhere. Why else do you have all these nifty virus checker, scanners, killers, etc. Why was GFA Systems hit by a virus that even made it onto some production disks? Why are people writing programs like Hospital, Sakrotan and why is Ed Krimen always using them. Because: a ROM based OS gives only one level of safety: you think you're sure the ROMs aren't and never will be virus-ridden (unless SOMEBODY inserted a virus into the release used to make the ROM masks, eh. This would be extremely bad because then you have a ROM based virus which cannot as easily be replaced as a virus-infected, diskbased OS.

Back to the original issue: I don't see too many (if any) arguments against distributing an OS on disk/tape/streamers. Most OSes come that way. Only a few don't.

Stop it right now, Martin, you're rambling again! OK, boss. :-)

So long,
Martin

>d:/cc10000.s : file not found
>

This happened to me when I first got GCC, the problem is that you have not set your enviroment variables correctly. The vital ones are:

GNULIB The location of the library (.olb) files.
GNUINC The location of the include (.h) files
GCCEXEC The location of the GCC executables

The one that is causing your problems is GCCEXEC, this does not fit the pattern of the other variables so can easily cause grief (I almost abandoned GCC when I had the same problems as you). It MUST end with a backslash while for the others this is optional, alse note that it is GCCEXEC not GNUEXEC. The GCC program should call the various compiler programs using their full names (check using the -verbose flag), if it does not then look at your GCCEXEC variable.

P.S. GCC is indeed the best thing since sliced bread.

Matthew

If the environment variable GCCEXEC is not properly set up, Gnu C
will print out the above message.
Try setenv GCCEXEC 'x:\iiii\gcc-'
or setenv GCCEXEC 'x:\iiii\gcc_'

- boot-strap) viruses.

The only program that I know of that looks for link-viruses is Atari Virus Killer (AVK). It's a commercial product that's up to version 3.9.

There's another program here in germany which examines the structure of executables and tells you if they are possibly infected. But it cannot cure the programs - I didn'd see such a virus killer for the ST until now. The program is called SAGROTAN and is up to version 4.12, I think. The author is Henrik Alt and at least version 4.03 is in the public domain (or should I better say freeware?). SAGROTAN is an easy-to-use GEM program and has some libraries of boot sector virii, executable boot sectors and normal applications which are user-extendable. I use it every time I get a new disk/program.
I don't know, if there's a version available by anonymous ftp. If not, I can upload it to our archive here (cs.uni-sb.de) or to atari.archive, in case it's not allready there. Is there any interest? (note that docs and program texts are in german)

I just d/led the file stef-gemlib.zoo from cs.uni-sb.de and it has
what appears to be complete AES/VDI support, although I will have to
wait until next week when I get back to work and my 4-Meg machine
to complie them up (gosh I wish I had the bucks to upgrade to 4-Meg at home)

If this doesn't provide the VDI support I need, maybe this gemfast13 will??
I checked the re-born Atarr.archive.umich.edu (Thanks guys for running this
service, I for one would never complain about your losing a few files, your
do a great job!!!)

Anyone know where the gemfast13 is located?

Message-ID: <1990Nov17.164848.26802@usenet.ins.cwru.edu>
Source record: 237235

What does everyone think of the new Atari Mega STe shown at COMDEX in Las Vegas?

It is suppose to have the same case as the TT though being grey not white.

It has 2 Serial ports, a LAN port, and a VME bus cart slot on the back.

It will have 2 megs of RAM, switchable 16/8 Mhz acceleration, 40 megabytes of hard disk, TOS 2.2, and the price will be somewhere under $1200.

The new monitor will be the SC1435 that is 15'' and with stereo sound.

The monitor should cost the same as the SC1224.

It is suppose to "knock out the Mac Classic."

I'm surprised I haven't read any messages on it already.

3366. MAZE Generator for the ST?

Maze generator for the ST?

Does anyone know where I can find a maze generating program for the ST? I work for about two hours a week with an autistic child who loves to do mazes, and would like to make my ST generate them instead of doing them all by hand. If anyone knows where I can even get a description of the process, I'll try writing the program. Any leads would be helpful.

Thanks,

David Jensen

For those who don't want to face wiring up a Microsoft mouse to their Atari, there is another solution. I just bought a Golden Image Mouse and I'm very pleased with it. They have an Atari ST version, so you just plug it in. The feel is similar to a Microsoft mouse, but the mouse is slightly larger.

It's made my working time with the computer much less stressful. I highly recommend it to anyone who works with their Atari a lot.

I'm not affiliated with this company in any way, I just like this mouse.

It cost me $70 Canadian, and was worth every penny. As a comparison, the standard Atari mouse costs $45 here.

Not true. I have NOT cut my mouse cable. I can right now, unplug my
Microsoft mouse from my ST, and take it over to my wife's PC and plug it
into either her serial or parallel mouse port. All my method is, is an
"adapter" cable to change the Microsoft mouse connecter to a DB9.

nc> One solution to the problem of fitting DB-9's with large housings into
nc> the ST is to go to your local electronics store (Radio Shack, for
nc> example) and buy a joystick extension cord. Plug one end into the
nc> mouse port, and then plug the fat connector into the other end. Make
nc> sure the cable you get has all 9 pins connected (the Radio Shack one
nc> does.) This also makes it easier to connect/disconnect the mouse and
nc> joysticks.

Well, I have both the Microsoft mouse and an Gravis Mousestick on my mouse
port, so I have a "Mouse Master" on it. Before I had the mousemaster, I
just had a "shell-less" DB9 connector plugged into my st's mouse connector.
If you build it well enough, it can easily handle a little pressure.
Heck, how often do you unplug your mouse? (Not very often, for me at least.)
But then again, for a company that stupid enough to stick the mouse/joystick
UNDER the bloody keyboard, grrr.... (no smiley here folks)

No, I don't work for Atari, Gravis, Microsoft, Practical Solutions.
In fact, I don't work for anyone, this week. :-)

3375. How to check HP Laserjet IIP Serial Port: Doesn't work with MacPrint

Newsgroup: comp.sys.atari.st
Date: 1990-11-18 06:49:25 UTC
From: ia4@cunixd.cc.columbia.edu
Message-ID: <1990Nov18.064925.20026@cunixf.cc.columbia.edu>
Source record: 237245
Cross-posted to: comp.sys.mac,comp.sys.atari.st,comp.sys.ibm.pc

Have an HP LJ IIP hooked on parallel with my Atari Mega4 ST. Works fine.
Now also have a Macintosh IIsi. Got MacPrint, a Laserjet Driver for the
Macintosh, that works with LJ's serial port at 19,200.

Installed, made LJ settings, and tried to print. Mac applications send page
to print, but the LJ front panel light does not light up, and nothing prints.

Returned MacPrint, got JetLink, another Mac driver for LJ printers. Same
problem. No print.

The Mac's serial port is OK because a modem works with it with the same cable.
So the cable is OK too.

Is there any way I can check the Laserjet's serial port from the Atari ST or
from my roommate's IBM PC? eg a DOS command(s), Basic Program, or something
like an Atari Desk Accessory would help confirm if I have a bad printer.

Appreciate your help/

Thanks

Imran Anwar

3377. TeX, and GNU C docs!

Newsgroup: comp.sys.atari.st
Date: 1990-11-18 12:20:14 UTC
From: jz06@vaxb.acs.unt.edu
Message-ID: <1990Nov18.122614.41115@vaxb.acs.unt.edu>
Source record: 237247

Anybody ever tried using TeX on the ST?

I got a copy of GNU C 1.37, unzooed it, and ran into the problem of the docs being in TeX format. So I get TeX. (I couldn't find the docs) Anyway, I FINALLY got that to process one of the files to produce a .dvi file.

THEN I got showdvi, and I can't figure out anyway at all to get it to recognise the fonts that I do have. (Seems all the fonts it asks for are the wrong 3 digit extension)

If anybody can offer help, or point out where I can FTP the Docs, I'd be eternally grateful.

-me.

(Ken Corey bb03@ponder.csci.unt.edu) (Don't email me, the mail-daemon doesn't work for myu account. Thanks.)

3378. Re: How to hook-up a MicroSoft mouse to an Atari ST

Newsgroup: comp.sys.atari.st
Date: 1990-11-18 13:41:52 UTC
From: chuck@mrcnext.cso.uiuc.edu
Message-ID: <1990Nov18.134152.12318@ux1.cso.uiuc.edu>
Source record: 237248

your note prompted me to re-attempt getting my 3 button logitech to work.
it's very slightly different from the microsoft. The two up/down wires
must be swapped--they are backwards from the microsoft configuration.
I connected the right and middle buttons--the middle and left buttons
work as right and left. Logitech's "technical information" is too
sketchy for me to do more than guess what's going on (a page and a half
on hardware and many more pages about software stuff that's of no use
toan st user.)

3379. XBIOS ikbdws()

Newsgroup: comp.sys.atari.st
Date: 1990-11-18 15:31:53 UTC
From: jimomura@lsuc.on.ca
Message-ID: <1990Nov18.153153.12097@lsuc.on.ca>
Source record: 237249

In further testing, I've tried code similar to the following
test code:

```
/* test.c */

#include <osbinds.h>

test()
{

extern char scrbuf[5];

scrbuf[0] = (char) 0x09; /* Set Mouse Report Absolute */
scrbuf[1] = (char) 0x01; /* MSB X for 319 */
scrbuf[2] = (char) 0x3f; /* LSB X for 319 */
scrbuf[3] = (char) 0; /* MSB Y for 199 */
scrbuf[4] = (char) 199; /* LSB Y for 199 */

ikbdws(4,scrbuf);

} /* End of test.c */
```

If you compile this down it looks like it should be right.
Yet when I run it, again, the mouse stops updating. At least
'graf_mkstate()' (AES opcode 79) doesn't receive new X-Y reports and
the mouse cursor stays in its last position. On the otherhand,
the 'shift key' report seems to be returned by 'graf_mkstate()'.
I know this because I'm using the shift key report to exit
a test loop.

Any ideas about what's going wrong?

>
>-steve
><selick@bucsf.bu.edu>

The <help> problem is on 1040STs with one meg of RAM, because the help page
is not supported in the 832K mode. GBS Newsletter number 4 mentions this, but
has no solution. The simplest fix is to upgrade your memory to 4 (or 2.5) meg.
I did this with the JRI simm board. You will need more memory any way for
sounds, which take up lots of room on the system heap. Print spoolers
like Multispool and ram caches for ATM eat up RAM as well. Finally, many
programs just will not fit in the 832K space. Mathematica wants at least
3MB and even then I've run out of RAM with it.

The 832K mode is kind of a kludge and should be avoided, if possible.
Features like the fading in of the first Mac screen are gone in the 832K
mode. Note that these features are only missing in the 832K mode, and if
you can do with less memory, they are there for the 512K mode.

There have been questions about sound with the Spectre here. I know I was
confused at first. Programs with sound will work, have been working since
Spectre 2.3K. The only sound problem is the System beep, in the Mac's system
software, which will be fixed in Spectre 3.0. To have sound like the System
beep, but fancier, use SoundMaster. SoundMaster is a freeware cdev; beware
of it tho, as sounds can eat up a half meg of system heap very easily. Note
that some earlier sound formats, like the SoundMover sounds, are incompatible
with SoundMaster --this is what caused my problems, as I had only some of
these incompatible sounds to test SoundMaster with.

If you use a lot of INITs and cdevs you may need to use a program like
HeapFixer (don't know the PD counterpart) to increase the memory allocation
to the system heap.

The 68030 board is still in development, as far as I know, and it will be for Mega STs, not 1040STs. There is not enough room in the 1040 for the 8 simms, I hear. Latter there may be a 1040 version. GBS licensed TOS 1.62 from Atari for the board, so it would work with ST software.

Hi Netters,

Does anyone one out there knwo whether the '.gif' format is supported
on the Atari St. I really want to be able to convert from popular standard
Atari formats such as Degas or Neochrome to '.gif' and back again.

And also is this '.gif' format the same as that used on Sun Work -
Stations??

I have looked on Lancs.pdsoft, but they only seem to have GIFFER ,a
display program for '.gif' pictures.And also Picswitch doesn't seem to support
the '.gif' format.

And lastly does anyone know why they are called '.gif' ???!???

Alan.

Hello everyone,

I'm looking for a program (or a series of programs) that will convert
PostScript file into encapsulated PostScript or into something that has
the chance to be printed. I've heard of Ultrascript, but I'm not sure
if the output can be sent to a Epson compatible printer or not yet - plus
it's fairly expensive. Thank you for any replies you can send.

-David

3386. Which machine to program for MIDI?

Newsgroup: comp.sys.atari.st
Date: 1990-11-18 22:54:21 UTC
From: darken-christian@CS.YALE.EDU
Message-ID: <27341@cs.yale.edu>
Source record: 237106

I am trying to decide whether to get an IBM compatible
or an ST to use for programming some novel MIDI processing
ideas. I know a fair bit about IBMs, but almost nothing
about the ST. Any opinions on which machine is better for
programming MIDI applications? The machine will have to perform
calculations while acquiring MIDI data. This can be done on IBMs
with an interrupt driven routine. Can the same be done on the ST?

One apparent advantage of the IBM compat is that there is
lots of sample MIDI source code available in the public
domain and from various vendors. I can save time and effort
by modifying these sources rather than starting from scratch.
Are there MIDI sources available for the ST?

Any tips gratefully received.

3387. FAT troubles

Newsgroup: comp.sys.atari.st
Date: 1990-11-19 01:45:28 UTC
From: n8742883@unicorn.cc.wwu.edu
Message-ID: <1990Nov19.014528.16629@unicorn.cc.wwu.edu>
Source record: 237107

Today I was working with unarcing some files while using
NeoDesk 3.0 as my desktop. I put a new disk in the drive and pressed
the ESCape key to tell NeoDesk to read the new disk info and display
the directory. The window refreshed itself with the same info-- for
some reason, the FAT had been written from the disk that was just in
the computer to the new disk I just inserted!!

While the directories of the two disks look identical, the
disk which had its FAT rewritten will not execute / print the files on
the disk as the files are nonexistant on the disk. A disk editor
showed me that the files do exist on the drive, but the FAT has been
rewritten to match the old disk.

I had run several programs which I had just unarced. Could
the symptoms be from a virus that was picked up off of one of those,
or does NeoDesk 3.0 have (gulp!) a bug hiding in it? I've never had
this problem before.

My system is an Atari 1040STf, 1 meg, 1 internal drive. The
window I was trying to reread was the B: window.

Any suggestions on what could have happened would be appreciated.

3388. ST for sale

Newsgroup: comp.sys.atari.st
Date: 1990-11-19 04:29:20 UTC
From: coteb@woods.ulowell.edu
Message-ID: <1990Nov18.232920.1@woods.ulowell.edu>
Source record: 237108

Hi all. I have decided to break up my system and sell it separately.
However, I will sell only if I can sell the monitor and CPU.

1040ST CPU(mouse and joystick included) - $400
SC1224 Color Monitor - $160

5 1/4" 360k Disk Drive -There is a loose wire in the case that
sometimes causes the drive not to be recognized. This can be fixed
since the drive easily comes out of the case. If I move the wire
around, it seems to be ok. Asking only $70 for this.

Software: Multidesk, LabelMaster, WordUp 3.0, Wordwriter, Music Studio
and quite a bit of PD software, and about 25 assorted ST mags.
Asking about $60 or best offer

I also have an Okimate 20 color printer that I never used because it
doesn't have the Plug 'N' Print module. It was a display model
at Sears so I don't know how good it works. They probably didn't use
it that much. I'd like $35 in as is condition or best offer for this.
Above prices do not include shipping. We can discuss that later.
Thank you very much.

3389. Terminal emulation

Newsgroup: comp.sys.atari.st
Date: 1990-11-19 05:59:12 UTC
From: ersys!prisoner@nro.cs.athabascau.ca

Message-ID: <901119072444@drdhh.hanse.de>
Source record: 237110

Hi Andrew !

(I wasn't able to get mail to you)

Just as Claus said:
Get your basepage pointer (_base in Laser / _BasPag in TC), determine the
offset from your text segment to your data segment (preinitialized
variables), add the size of a tos program header (28 bytes) and the
offset of the variable you want to save (rel. to data seg) and you
get the offset into the executable file.

You should declare such variables always global and preinitialized,
otherwise they are allocated on the stack or in bss.
Take a symbolic debugger and look at your compiler output to find
the locations.

Be aware of compilers that initialize at runtime (old Megamax did, don't
now about Laser, Turbo doesn't).

Hope that helps,
Bjoern

P.S:
If you have further problems -> contact me but please keep short,
I have to pay for INCOMING mail.

In other words, compilers are free to warn about anything they like
(`foo.c, line 354: warning: code written at 4 AM'). [Chris Torek]

3391. Stacy's trackball

Newsgroup: comp.sys.atari.st
Date: 1990-11-19 07:30:13 UTC
From: pdel@ADS.COM
Message-ID: <?3+^~&%@ads.com>
Source record: 237111

The other day I took a look at the Stacy. Everything seemed fine except that trackball. Seems to be totally useless. Does anyone think they'll come out with a new version with normal trackball? It doesn't seem right to have to buy another one to make up for the one on there. Also would seem to take away from the portability feature if you had an external mouse.

I really like everything else on it, as well as the price.

Just thinking out loud......

|> As the author of the program I would like to comment on this. I am
|> really
|> looking for a suitable compression algorithm. I want an algorithm which
|> is fast as has acceptable compression ratios.

I suggest the compression scheme implemented in Arc or Zoo. Advantages:

- sources are freely available,

- the compression factor is really good (somewhere in the 40-50% order),

- fast, at least in the long run.

Let me comment on the last statement as one might well argue about that. I
do backups in the following way: First I do a full backup, then I do a
differential backup once a week. When I am about to run out of backup disks
I have to do another full backup.

Now, doing a full backup takes a lot of time so it would be nice if it
could be done one as seldom as possible. On the other hand during one week
between two backups generally only few files change so the time for a
differential backup may well be neglected (well, almost). With a very good
compression scheme the backup disk pool can be exploited much better and
the time consuming full backup is not neccessary that often.

Bottom line: The time to write data to disk is only one side of the coin.

>Can some cleverer person tell me why the GEMINI console window fonts work
>under AMCGDOS but are garbled when I try to use G+DOS??

I can't quite remember the specifics, but it's something to do with the fact that GDOS fonts can be in Motorola or Intel format (there's a flag in the font header somewhere to say which). AMCGDOS seems to support fonts in both formats, but both GDOS and G+PLUS only support Intel format fonts.

The Gemini font used in the console window is probably in Motorola format.

You may be able to fix this with some kind of utility, or assign the same font id that the console font uses to a different font.

++ > gcc: /tmp/cc1000000.cpp cannot find file.

++ Query: I notice that in your examples, there are 9 characters before the
++ '.cpp' tag on the file.

Sorry, heavy-handed typing, it should be /tmp/cc100000.cpp. It appears that
the problem arises from GCC's interpretation of pathnames for GNUINC and
a few little problems like requiring quotes surrounding

setenv GNUINC='c:\gnu\include'

do the quotes remain for ENVIRON.PRG? If the environment variable is set
by both ENVIRON.PRG and GULAM.PRG, which wins --- and when?

I am running all the cross-permutations to find out which is

1. legal

2. preferable

More later.

>...
> Any suggestions on what could have happened would be appreciated.

What happened is pretty clear. TOS failed to recognize the new disk, so it continued using its cached copies of the FAT and directory from the old disk. I'm surprised that the new disk was clobbered unless you actually attempted to write something on it.

Why it happened is more of a mystery. The way things are supposed to work is that TOS senses that the medium (disk) might have changed and rereads the boot sector. (The hardware is such that it can't tell for sure.) If the 24-bit disk ID field in the boot sector has changed, then it knows a new disk is in the drive; otherwise, it assumes the same disk is still there. If your two disks had the same disk ID, that would be enough to explain the problem, for then TOS would not know you had switched disks.

The TOS desktop and most ST formatters generate a random ID field, so this problem rarely arises. However, some copy programs copy the entire disk, including the ID field, and they can lead to these kinds of problems. Also, I understand that IBM PC's do not use the ID field, so disks formatted on a PC might end up all having the same ID.

You didn't say which version of TOS you are using. This problem has been lessened in TOS 1.4. There, I believe that pressing ESC causes TOS to assume a new disk, regardless of whether the ID fields match. With the older version of TOS, pressing escape causes the boot sector to be read and the ID fields to be checked, but a new disk is assumed only if the ID's differ.

Everyone keeps on talking about the Golden Mouse but no gives the frigging address or phone number of where to order it from! Unfortunately, "What's This Computers" only seems to carry the Atari Mouse and they sometimes take a bit of time in getting special orders.

BTW my mouse has been starting to lose the up direction. However I noticed when i took off the cover and rolled forward and back that the ball was slipping on the up motion. I cleaned the ball and it now works fine again. I suspect that the spring in the support roller not strong enough to push the ball tight up against the sensor rollers when rolling up or right.

Message-ID: <1990Nov19.110526.7418@umiami.ir.miami.edu>
Source record: 237120

THE FOLLOWING IS TAKEN FROM THE Usa Today, Friday November 16,1990

Atari Corp., thge company that spawned the video game craze, is making its second stab at ethe USA's buisness computer market.
Atari unveilded a PC for the office - Called the MEGA STE - that will sell for $1799. The plus to this PC is its low price. The drawbacks: At its heart is the 68000 microprocessor, a computer chip that is three generations old. And Atari machines do not use IBM compatable software, but programs based on the less popular GEM operating system.
"We hope 1991 will be the year we start to take a chunk of the US market," says Lawrence Siegel, VP of software. Siegel, however, conceeds it's going to be tough.
As if on cue, one big name Atari fan strolled through the Atari exhibit here - Bruce Johnston, keyboardist and songwriter for the Beach Boys. He was in town performing with the band at Ceasars Palace and wanted to take a look at Atari's laptop, the $1200 to $2500 STacy.
"We're not in bed with Atari," says Johnston. "It's just they have the stuff."

>demo of that around? Which is better? I'm not looking to make a living
>out of this, just some reports and such.
>I don't suppose they offer us poor students a break, do they?

Personally, I like Timeworks as a cheap, #75 (~$150) but powerful package.
I can only compare it with Calamus and quite frankly for the price, Timeworks knocks spots off it! Timeworks is GDOS based and hence can use just about any font available in that format. Its advantage is with the bit-mapped fonts as these translate to dot-matrix printers or lasers quite well. Calamus uses outline fonts which when displayed even on a Lasejet II look blocky and ragged!! Where Calamus wins is in the graphics. It can handle both vector and raster graphics well including facilities for uploading from a scanner. Timeworks only uses bitmapped graphics and suffers if the image is severely compressed.

To be fair I must mention the ages of the packages, My version of Timeworks I think is 1.12 and is 1 year old. Calamus I saw on a friends computer and was *considerably* older than that - things do advance so draw your own conclusions.

If any program uses forward slashes in TOS-calls related to filenames, you can use unx2dos.prg from cs.uni-sb.de (directory /pub/atari/bin) in your auto-folder. This program does nothing else than converting these slashes to backslashes and the /dev/A notation for drives to A:. For a more complete description of the filename conventions used by gcc, you can read UNIXMODE.doc (also on cs.uni-sb). This file describes the UNIXMODE extended filename standard proposed by Eric Smith.

I've had nearly the same thing happen with my setup. I have Neodesk 2.0 that
I use with my 520ST (recently updated to 1 meg), 1 internal, and 1
external drive.
Sometimes when I switch the disk in drive B, and ask Neodesk to update
the window,
seemingly without even checking the drive, it refreshes itself with the info
from the previous disk. Closing and opening the window achieve the same
result.
Sometimes I have to change disks several times before it is recognized, or else
I update drive A, and then drive B. Another, more disturbing result is that
sometimes Neodesk will tell me that drive B contains some folders with
unprintable names (control characters and such). It goes on to say that I am
using up -17348542 bytes in 3 items. At other times I have had nearly
a gigabyte (!) of disk space used on a standard double-sided disk, or so
Neodesk
says. I haven't had any problem with the disk being damaged or changed in any
way, however. When I examine the disk from Atari's desktop, I never have any
problems.

At first, I thought it was my disk drive (Master 3S), but now I'm beginning to
wonder...

-Steve Gemma

Hello all netters! This is a newsworthy note, and a call for information from our brothers (and sisters) across the water.

Double Click Software will be attending and displaying and selling our wares at the 3rd 16 bit Faire in London on Jan. 4-6, 1991. We hope to meet many of the netters out there!

In addition, we will be visiting France, Germany and Holland/Netherlands for two days each from Jan 8-13 (in that order).

We would appreciate any reccomendations for _inexpensive_ places to stay while we are in these countries. Not being a large rich company, we are looking to cut expenses in any manner possible.

Also, if you would like to meet us, or have us attend a users group meeting to show our wares and speak, we would be very honored. Please reply in email to any of the above.

We are extremely excited with the possibility of meeting with as many of our fellow netters as possible.

AND, if you can direct us towards distributors and/or dealers in the above countries (along with phone numbers) we would like very much to contact them.

Thanks, and we hope to hear from some of y'all soon as well as meet y'all!

- mike, paul, gilbert and keith

3407. Double Click at 16 bit faire

Newsgroup: comp.sys.atari.st
Date: 1990-11-19 18:04:05 UTC
From: uace0@menudo.uh.edu
Message-ID: <1990Nov19.180405.23276@menudo.uh.edu>
Source record: 237127

As the title appropriately states, Double Click Software will be taking out a booth at the 16 bit faire in london on jan 4-6. Please come visit us if you are attending the show.

We are desperately seeking someone who would volunteer the use of an ST computer system for our use at the show. We can arrange a free pass for Jan. 4, and for discount passes on Jan 5&6 (2 pounds off the price).

If you can help us out, we will give you the free passes (as many as you would like) and we will give you one each of our software products. The show exhibitors are not arranging for equipment, and we are in need of something to use at the show.

If no one can provide us with the use of their equipment, then perhaps at least a monitor. We are hoping to bring our hard disk and STacy along, so a monitor would work (assuming we can bring the above).

Thanks in advance. We hope to meet and see a lot of our net friends at the show in London!

- mike, paul, gilbert and keith

From: Henry_Burdett_Messenger@cup.portal.com
Message-ID: <36073@cup.portal.com>
Source record: 237128

Compression should never, ever be used in backups. The idea of a backup is to enhance data security by providing alternate copies of data to be used the event of a failure or accidental deletion.

Compression makes your backups less secure by increasing the significance of each bit in the backup saveset. (e.g. if you lose one bit in a compressed saveset, it is very likely that you will lose the file that holds the bit; you may lose the whole saveset.)

Most real backup systems for minicomputers or mainframes not only don't compress, but they include redundant information to recover from a media error. (VAX/VMS Backup XORs the blocks in a "redundancy group" and stores that result; this allows single failures in a redundancy group to be corrected.)

Backups are no good if they fail when you need them!

3409. Deskjet 500 printer driver

Newsgroup: comp.sys.atari.st
Date: 1990-11-19 19:56:44 UTC
From: psurge@cs.utexas.edu
Message-ID: <14861@cs.utexas.edu>
Source record: 237129

Does anyone have the gdos system file called HPJET300.SYS?

This is a gdos printer driver for the HP deskjet 300.

Neocept's Turbo jet software package had the drivers in them, however
Neocept is going under, so this package is no longer available from the company.

If anyone has this, and it is not considered illegal, then please send this to
me.

Thanks.

3410. MT C-Shell & VSH Version 2.0 Announcement

Newsgroup: comp.sys.atari.st
Date: 1990-11-19 20:48:05 UTC
From: david@bdt.COM
Message-ID: <6547@bdt.COM>
Source record: 237130

I received so much mail requesting information (I'm not complaining) and I got so many bounced e-mail messages when I tried to reply, that I'm simply posting this fairly brief announcement, with a little bit more information about MT and VSH and the upgrade proceedures. I guess I'll just get ready to take a few lumps for doing this...

Thank you.
--
David Beckemeyer

========== CUT HERE ========== CUT HERE ========== CUT HERE

ANNOUCEMENT!!! ANNOUCEMENT!!! ANNOUCEMENT!!! ANNOUCEMENT!!!

Announcing MT C-Shell Version 2.0 And VSH Version 2.0

MULTITASKING JUST GOT BETTER

Version 2.0, the third generation of this mature and stable system, is a major upgrade from previous versions. With Version 2.0, MT C-Shell has been drasticly revised and improved.

FASTER THEN EVER!

All 70 plus MT C-Shell commands have been upgraded and offer significantly improved performance.

FULLY TT030 COMPATIBLE!

A new version of the Beckemeyer Real-time Multitasking Operating System Kernel has been specifically designed for the new Atari TT computer. This new operating system takes advantage of the 68030 processor and implements new TOS system calls introduced with the TT. Of course MT C-Shell and VSH are alse fully compatible with the Atari ST computers as well. There is also a brand-new RTX for the 16-bit ST series computers too.

VIRTUAL CONSOLES

Now included with MT C-Shell is a system which allows you to switch between multiple full-screen sessions using a "hot key". This feature allows you to have multiple MT C-Shell sessions active concurrently, as if you had several terminals sitting on your desk!

Some of the other new features of MT C-Shell Version 2.0 are:

o Now fully supports User ID and Group ID numbers

o Processes are assigned unique PIDs in subsequent incarnations

o Config program helps set options (e.g. Memory quotas)

o Pseudo-TTY driver with GEM Windowing interface included

o Many internal improvements and speedups

VISUAL SHELL MANAGER

VSH is like a graphics workstation on a disk!

Just look at these new features in Version 2.0:

o Cut & Paste between windows

o Save window or paste-buffer contents to a file

o Set options individually for each window

o Choose fonts for each window

o Install custom program Icons onto the VSH Desktop

o Works in all resolutions, including TT and Moniterm

o Save settings and postions for all windows & icons

Also included are the following VSH Desk Accessories:

o Analog Clock

o CPU Load Monitor

o DEGAS Picture Viewer in GEM window

With the new VSH Version 2.0, you can now install icons for your favorite programs -- no more searching all over the place. The VSH icons use the DC-ICE format, and can easily be customized. You can install unique icons for all your programs.

UPGRADE POLICY

The MT C-Shell upgrade is $39 US. You must send your MT C-Shell disk in for update. There is a $5 fee for replacement disks. The VSH upgrade is $15 for registered owners of VSH. If you are a registered MT C-Shell owner, but you DO NOT have VSH, you can order VSH with your MT C-Shell upgrade for the discounted price of $24. The suggested retail price of VSH Manager is $34.95 US. The suggested retail price of MT C-Shell is $129.95 US.

I recently downloaded GNU CC. The only trouble is, whenever I try to compile
a file using GCC, I get the error '/tmp/cc100000.cpp: file not found'.
My first question is, what is this file and how do I obtain it?
My second question is, does GCC have to be run through an Atari version
of UNIX, or can it simply be run through GEM?

BTW, I have an Atari 1040ST with a 20meg hard drive.

You've gotta be kidding!

a) A "suped up" STe would have a lot more than 500 colors. (In excess
of 4096!)

b) It would cost a heck of a lot more than $200. (STe is about $600?)

A while back (when I first replaced an aging Compaq with an even older ST), I had the same type of problem. The fix was stumbled onto accidentally, may be extremely unrliable (ie. it might not work for you), and it SAVED MY BUTT.

What I did was put the disk through the VKILLER program (PD on atari.archive). When I "killed" the non-existing virus. My FATs were all fixed up. (There is more than one copy of the FAT. VKILLER recontructs the FATS from the copies.)

Good Luck,

>by both ENVIRON.PRG and GULAM.PRG, which wins --- and when?

If you run ENVIRON in your AUTO folder, every program you spawn from the desktop will get a copy of the values you set with ENVIRON. When Gulam runs and gets a setenv command, the changes that it makes are to the copy of the environment that it received. In this copy, any setenv command will completely replace whatever values it inherited from ENVIRON. If you've got things working with ENVIRON, then you don't need to set them again in Gulam.

Please note - in Gulam, you leave out the '=' equals sign in the set[env] commands. e.g.
setenv GNUINC c:\gnu\include

>a better product out now (I should know, I bought the Supra) from ICD, and it's
>about $130 mail order. This is called a HOST ADAPTER. Everything is an
>interface these days, so let's keep things clear.

I just bought an ICD host adapter last week, for around $84. This is their
Advantage ST, minus clock, which I didn't need for use in my Mega. Their
AdSCSI ST Plus has the clock, and is 10-20 bucks more, and also about twice
the size.

>The Host Adapter plugs into the ST's DMA port (one of the very wise parts of
>an ST) and converts these signals to be SCSI compatible. You can have up to
>10 DMA devices, and data rates have the potential to be 2 Megs per second
>through this port. Fast!

Just to add here - the ICD docs say they support the full SCSI command set,
and will also support SCSI-2 commands. Sounds cool to me, tho I've yet to
obtain any hardware that needs the SCSI-2 compatibility...

>Okay, so that's a start. You mentioned cheap IBM-PC style drives. But now we
>only have SCSI compatibility. Whoops! So you need to convert from SCSI to
>ST-412/506 now, if you want to use an off-the-shelf MFM or RLL-encoded PC type
>hard disk. What now?

>Well, the best and easiest choice is to get an SCSI compatible drive instead.

I concur. These are the best performance drives, anyway...

>This costs $30-$150 more than an equivalent ST-412/506 hard disk. The other
>choice is to buy a second "adapter", which converts from SCSI to ST-412/506.
>These come in both MFM and RLL flavors, and Adaptec is a good choice. They
>sell them for about $130, depending on the model. It will let you connect
>TWO cheap PC-type hard disks with one board. An extra savings...

I've often wondered if that was the way to go... more drives per controller sounds like a good idea, dunno why. Just a gut feeling.

>But now you need a hard disk, and hopefully one that's supported by the Supra
>or ICD formatting software. Otherwise you need a lot of specific information
>about your disks. And you need a box. And you need a power supply. And you
>need cabling. And you need the luck of the Irish, because if just one of all
>those connections you made is flaky, it is a long, arduous trail. It takes
>very sophisticated equipment to debug a hard disk setup -- or lots of trial and
>error.

Hey, I have a shoebox case with 40 watt power supply I will be trying to get rid of Real Soon now... It ran a Quantum 80 and Miniscribe 8425S faithfully for 2 years. (Setup for 2 half-height or 1 full-height drive, power for 2 drives plus fan.)

I guess you do need luck in getting good parts, I haven't had trouble on this end yet. You *do* need to be *incredibly* careful about the cabling though... That's why I'm selling this case and power supply, and needed a new host adapter last week, 'cause I wasn't careful enough. Don't ever ever ever plug a SCSI cable in backwards. I fried my old Supra host adapter and my Quantum drive. (Really fried the host adapter. smoke, vaporized PCB traces, the works. Sigh. And that one had a working clock and battery on it...) Needless to say, mistakes can be very expensive. I still have to get my drive repaired.

>If you approach the chore correctly, you can do all this, save $50 - $200 over
>the cost of a mail-order ready made hard drive, and have a dependable machine.
>If, say, you get a bad part in the mail (which one) it is sheer hell. I went
>through all of this about two years ago, and wound up with a 65 Meg hard disk
>after six months of struggle. Not only did I get a bad hard disk, I got a bad
>Adaptek SCSI-RLL adapter!

>I'd still do it again, rather than buy a new setup. It has run without fail
>since then, and I need more space now.

Heh - that was the exact reason I got started on this ordeal... Got a Syquest drive and needed to move to a bigger case to hold everything. Mounted the Quantum upside down relative to its old position, didn't notice that I now needed to twist the cable around to match... Plugged everything in straight, and boom. At least the other drives didn't smoke too, I would've probably thrown everything out the window at that point.

Oh well. So now I have a brand new Syquest staring at me, waiting for me to fill some cartridges (this is neat!) with data. Of course, I *had* been planning to use it to back up my Quantum..... Sigh. 88 megs, and nothing to do.

Don't let this happen to you...

I still think it's worthwhile to build your own system, if you're at least half competent. (As obviously I am not. Sheesh.) Mail order places sell these Syquest packages for around $700-900, and I got mine for about $500, plus the $85 for the unexpected expense of a new host adapter...

>a) A "suped up" STe would have a lot more than 500 colors. (In excess
>of 4096!)

Over 500 colors onscreen at once - this means either the fancy palette tweaking that Spectrum 512 does in low-rez, or that there are 9 or more bitplanes available. Since dealing with the timing required by things like Spectrum is pretty unappetizing, especially for fast action graphics programming, I'm inclined to take this as claiming a nice large color lookup table. Just as a reference, PC-style SuperVGA is only 8 bitplanes, 256 colors in its lookup table.

>b) It would cost a heck of a lot more than $200. (STe is about $600?)

So it goes. If it's a game machine only, mebbe they're saving the cost of the keyboard and it's associated hardware - keyboard processor, clock, and joystick and mouse and serial ports. Probably also remove any floppy drive and controller, so who knows, they could shave the cost down.

But the Panther doesn't exist, so this is all a moot point, eh?

From: Henry_Burdett_Messenger@cup.portal.com
Message-ID: <36080@cup.portal.com>
Source record: 237138
Cross-posted to: comp.sys.mac.misc,comp.sys.atari.st,comp.sys.ibm.pc.misc

Imran Anwar writes that he is having trouble making his Macintosh
print on his HP LaserJet IIP. One of the tests he performed was
to use the same serial cable to connect to a modem successfully.
From this he inferred that the cable and port are working properly.

That turns out not to be the case. As a matter of fact, if you
connected to a modem successfully through this cable, I can
pretty much guarantee that cable won't work with a printer.
Modems are DCEs, printers and computers are DTEs. You need
a null modem cable to connect a printer (or terminal) to a
computer, and a straight through cable to connect to a modem.

Go to your computer dealer and get a Mac -> Imagewriter cable.

In this list, games have been rated on a scale of 1 to 10, 10 being the best and 1 being the worst. For each game, the total number of votes, the average rating, and the vote distribution are shown. New games are indicated by a "*" before their entry. If a "(C)" appears after the title it means that the game is a CD-ROM or disc system title. If a "(J)" appears after the title it means that the game is currently only available in Japan.

The general guideline for ratings is:

8-10 worth buying at full price
6-7 worth buying at a discount, or if you're particularly interested in this kind of game
3-5 only worth renting
2 only worth playing for free, and only for a few minutes
1 worthless

The vote distribution uses a single character to represent the percentage of votes for each ranking. The following character codes can appear:

"." no votes cast "3" 30-39% of the votes "7" 70-79% of the votes
"0" 1-9% of the votes "4" 40-49% of the votes "8" 80-89% of the votes

3420. Color Unix Windows...

Newsgroup: comp.sys.atari.st
Date: 1990-11-20 05:12:06 UTC
From: icsrc127@Msu3.oscs.montana.edu
Message-ID: <0093FF84.C42213C0@Msu3.oscs.montana.edu>
Source record: 237140

Has anyone ever converted Unix windows for use with a color monitor. If so, is there an ftp site I can get it from. Your information is appreciated. Thanks ahead.

3421. Re: Spectre and Mac hard drives

Newsgroup: comp.sys.atari.st
Date: 1990-11-20 07:03:13 UTC
From: dsmall@well.sf.ca.us
Message-ID: <21730@well.sf.ca.us>
Source record: 237141

-- the base question dealt with Spectre and Mac hard drives.

Spectre up to version 2.65C was only able to deal with the earlier Mac hard disk scheme. This was changed, oh, around System 6's release, to a new one Spectre did not understand. This^? is why you are unable to read a Mac formatted syquest read under Spectre.

Spectre 3.0 fixes this problem (and many other minor bugs like this). It recognizes both Apple HD schemes.

The MegaTalk board that's close will also allow direct Mac SCSI access, DB-25 connector and all.

Spectre 3.0 is in final, final beta test. It's down to piddly little bugs that we want to get out of it before we ship. The newsletter is done to announce it and will be mailed shortly.

Sorry for the late reply; Comdex prep and Comdex interfered a lot.

-- thanks, Dave / Gadgets by Small

I haven't thought of a clever saying for down here yet

Hello!

Because this question arises from time to time I'd like to give some hints:

Atari Germany (ATARI Computer GmbH, Frankfurter Strasse 89-91, D-6096 Raunheim, FRG, Tel: +49 6142 2090) is selling a complete port of the X-environment for all ST's and TT's. The only requirement is a main memory of at least 2 MB. This port was done by a company in Germany (X software, Marktstrasse 8, D-8944 Groenenbach, FRG, Tel.: +49 8334 1411, Fax: +49 8334 6245). It is sold since Nov 1st, 1990. Below is a pricelist I received last week from X software.

The product is called "X/ST/window" and consists of different parts:

1. Computer

ATARI 1040 ST/E (2 MB, without Monitor) 1498,- DM
ATARI 1040 ST/E (4 MB, without Monitor) 1998,- DM

ATARI Mega ST 2 (2 MB, without Monitor) 1298,- DM
ATARI Mega ST 4 (4 MB, without Monitor) 1798,- DM

ATARI TT030-4 (4 MB, with 14'' VGA Monitor, 48 MB Harddisk) 6098,- DM
ATARI TT030-6 (6 MB, with 14'' VGA Monitor, 48 MB Harddisk) 6698,- DM
ATARI TT030-8 (8 MB, with 14'' VGA Monitor, 48 MB Harddisk) 7198,- DM

2. Monitors

ATARI SM124 (for 1040 and Mega ST) 318,- DM
ATARI SM194 (for Mega ST) 3998,- DM

3. Ethernet-interfaces

ATARI Net (plug in MEGA ST, Cheapernet/Thinnet and Ethernet/Thicknet, only for MEGA ST and only in combination with SM124) 998,- DM

Biodata BioNet 100 II (For extern connection to DMA port)
(Cheapernet/Thinnet) 1398,- DM
(Ethernet/Thicknet) 1398,- DM

Riebl Card Plus (plug in TT, VME Bus, Cheapernet/Thinnet and Ethernet/Thicknet)
998,- DM

4. Software

X/ST/window (for only monitor SM124) 598,- DM
X/software X/ST/window/SM194 (monitors SM124 and SM194) 678,- DM
X/software X/TT/window 998,- DM

5. Packages

ATARI 1040 ST/E (2 MB), SM124, BioNet 100 II, X/ST/window 3750,- DM
ATARI 1040 ST/E (4 MB), SM124, BioNet 100 II, X/ST/window/SM194 4050,- DM
ATARI Mega ST 2 (2 MB), SM124, ATARI-Net, X/ST/window 3150,- DM
ATARI Mega ST 4 (4 MB), SM124, ATARI-Net, X/ST/window 3650,- DM
ATARI Mega ST 4 (4 MB), SM124, ATARI-Net, X/ST/window/SM194 3690,- DM
ATARI Mega ST 4 (4 MB), SM194, BioNet 100 II, X/ST/window/SM194 7700,- DM

Prices include package, but no shipping, no value-added tax (currently 14% in Germany). The dollar sells today for 1.46 DM which means you have to multiply the prices in DM by 1.5 and add 14% to get final prices (but without shipping).

Some words to the software: X/ST/window/SM194 allows to simulate multiple SCREENS on ONE monitor (as is for example the case with the MIT X-Server for color SUN workstations, moving the mouse of the screen produces a second on the color SUN).

X/ST/window is based on X/ST/multi a multitasking OS completly compatible to TOS. It offers FTP, telnet, etc.

X/ST/window displays only a portion of the actual screen. The width and height of the virtual screen are only limited by the available main memory. Moving mouse to the border of the virtual frame scrolls frame automatically.

X/ST/window is yet X11R3.

Disclaimer: I haven't yet seen the software nor am I in any connection to ATARI or X software. This is simple a typed in version of a letter I recept last week in order to let the world know that ATARI itself is doing some effort in recovering lost ground. ATARI claims to be selling this soft- and hardware worldwide.

Matthias

3423. initex (help)

Newsgroup: comp.sys.atari.st
Date: 1990-11-20 07:53:55 UTC
From: uttwkt@utrcu1.UUCP
Message-ID: <732@utrcu1.UUCP>
Source record: 237143

I am trying to make a new version of LaTeX (with dutch hyphenation rules), and therefore I run "initex" on a file called "nlplain.tex" to create the file "nlplain.fmt". Halfway the program stops with an errormessage: "Sorry, Tex capacity exceeded [Pattern memory=8000]". Now my question is: is there a bigger version of "initex" available somewhere? (for instance an ftp-site). Please send me the names (and numbercode!!) of these sites. Or could someone send me a version of initex with more memory? (I am not capable of recompiling a new version of initex myself.) I have a Atari 1040 ST.

Thanks very much!!

3424. STe troubles, video weirdness

Newsgroup: comp.sys.atari.st
Date: 1990-11-20 08:50:41 UTC
From: hyc@math.lsa.umich.edu
Message-ID: <1990Nov20.085041.25605@math.lsa.umich.edu>
Source record: 237144
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Sorry to stir up the pot with what seems to be a now-dead subject, but I don't recall the resolution of all the horror stories, and now have a (horrifying) 1040STe of my own to deal with. The main problem I'm having is that just about everything that loads up gets partially written onto video memory. I get vertical lines, I figure 16 pixels apart. I would have expected a plain-old overwrite problem to wipe out a couple rows, starting at the top of the screen. Instead I get 1 pixel wide vertical lines, evenly spaced out, and occasionally the bottom of the screen gets trashed. What's going on?

The STe arrived with the STE_FIX program in the AUTO folder of its language disk. Can't boot into medium resolution without it. Yeehah.

Along other lines... I just started using ICD's boot stuff with this new host adapter... Apparently, whenever the driver detects a write failure, the thing shifts the video into medium resolution. What I'm seeing is on my multisync monitor in monochrome mode, all of a sudden there'll be a glitch and my screen has been divided in half, vertically down the middle. Everything is drawn in both the left and right halves of the screen. The screen borders are resized, and look like the color rez borders, but everything stays in black and white. The preferences menu still says high rez. This is incredibly annoying, as well as making some stuff unreadable. (Although some of it is interesting, really. Anyone for a 4 pixel wide font? 160 columns of text. Oooo....) It says it's version 4.8.4, by the way.

|>This is a gdos printer driver for the HP deskjet 300.
|>

No it's not. It's gdos driver for the HP DeskJet in 300 dpi quality.

3427. TeX 3.1 and Metafont 2.7 also runs on Atari ST's

Newsgroup: comp.sys.atari.st
Date: 1990-11-20 09:49:35 UTC
From: ridderbusch.pad@nixdorf.com
Message-ID: <RIDDERBUSCH.PAD.90Nov20094935@ugus21.nixdorf.de>
Source record: 237147
Cross-posted to: comp.sys.atari.st,comp.text.tex

Hallo TeXperts and TeXnicians.

In TeXhax digest 90 Karl Berry announced, that he had released web2c version 5.8a (that's TeX 3.1 + Metafont 2.7). This version also works for the Atari ST with very minor changes. I build the Atari version with a GNU cross compiler on my local UN*X box. I don't know, if all files will compile on every ST (due to lack of memory); I recompiled only two or three files on my ST, which is equipped with 2,5 MB. People with 4 MB should have no problems at all. In every case, the conversion from WEB to C should be done a UN*X system.

You have to build a normal sized TeX and Metafont. Metafont additionally requires to decrease some constants. The resulting object have the following sizes.

```
tex/initex:
text size 202840
data size 1228
bss size 1125404
symbol size 16954
File is relocatable
tex/virtex:
text size 187828
data size 1228
bss size 681552
symbol size 16548
File is relocatable
mf/inimf:
text size 201992
data size 1268
bss size 291232
symbol size 16660
File is relocatable
mf/virmf:
text size 194020
data size 1268
bss size 291228
symbol size 16562
File is relocatable
```

I used the GNU C library from J.R. Bammi and E.R.Smith (thanks to both of them for their good work) with patchlevel 58. The required getl() routine in the library contains a bug, because a variable is anded with 0xff instead with 0xffff. The following is the correct version.

```
long getl(fp)
register FILE *fp;
{
register long n, c;
if((c = getw(fp)) == EOF)
return(EOF);
n = (c << 16);
if((c = getw(fp)) == EOF)
return(EOF);
n |= (c & 0xFFFF); /* the original contained 0xff */
return(n);
}
```

Following are the contex diffs to the original web2c 5.8a. BTW, you should be aware of the setting of the UNIXMODE environment variable. I've set it, so that all path specifications are given with a device prefix (/dev/F/tex or /dev/D/metafont/mfinputs/cmr) and the default open mode is binary.

And now have fun.

Hello!

Did I hear that the Unix 'sc' spreadsheet was available for the ST ?

If so, where can I obtain it ?

Thanks,

Mike

>your enviroment variables correctly. The vital ones are:
>
>GNULIB The location of the library (.olb) files.
>GNUINC The location of the include (.h) files
>GCCEXEC The location of the GCC executables
>
I made modest modifications to the "gnu.g" file supplied by J. Bammi,
and had complete success the first time I used the GCC compiler.
My modification of his file starts with:

```
# Sample Gulam script
# set up commands for gcc and gas
#
alias cc f:\gccexec\gcc
setenv cc f:\gccexec\gcc.ttp
alias as f:\gccexec\gcc-as
setenv as f:\gccexec\gcc-as.ttp
alias cpp f:\gccexec\gcc-cpp
setenv cpp f:\gccexec\gcc-cpp.ttp
```

and ends with:

```
#
# NOTE: beginning with gcc V1.37, GNUINC and GNULIB can be
# ',' or ';' seperated list of dirs.
# gcc-cpp looks for GNUINC first, if not found then GNULIB
#
setenv GNUINC 'g:\include,f:\include'
setenv GNULIB 'f:\lib,g:\lib'
setenv GCCEXEC f:\gccexec\gcc-
setenv TEMP h:
```

I hope this helps.

3436. Re: UniTerm and Z-modem

Newsgroup: comp.sys.atari.st
Date: 1990-11-20 13:50:24 UTC
From: roberson@aurs01.UUCP
Message-ID: <59352@aurs01.UUCP>
Source record: 237056

I was just wondering about uniterm and zmodem last night! It has been a very looong time since Simon Poole released a new version of uniterm.

I was wondering if anybody (Simon?) knows if a new version will ever come out? If Simon even still programming for the ST?

Anyway, I'd love to see a version of zmodem built into Uniterm. I've been using uniterm's built-in xmodem, but it will accept an EOT during the middle of a binary transfer and basically hang/mung the transfer.

Zmodem with its built-in error recovery seems like an obvious win.

If Simon isn't maintaining the Uniterm source, has he released it to anybody else to maintain?

Thanks,
-chip

They are called .gif 'cos it stands for Graphics Interchange Format.

And if anybody knows where I can get a Gif viewer for the ST (or a converter)
then please let me know as well!

3440. GNU C

Newsgroup: comp.sys.atari.st
Date: 1990-11-20 16:25:03 UTC
From: dkoski@hercules.as.arizona.edu
Message-ID: <493@organpipe.UUCP>
Source record: 237060

Has anyone out there been able to get GNU C to compile a decently large file? I got GCC off of atari archive and installed it on my HD, and compiled a couple benchmarks, but when I tried to anything larger than about 120 lines it ran out of memory. I stripped my system to the bare minimum and had about 850K left over (out of 1 meg), but this only gave me the ability to compile about another 40 lines. BTW, when I use optimization, I can compile files that are <50 lines.

Please help!

David Koski

3441. Cyber Studio

Newsgroup: comp.sys.atari.st
Date: 1990-11-20 16:46:31 UTC

Cross-posted to: comp.sys.atari.st,uw.sys.atari

I just recently got Cyber Studio and I am looking for some
CAD-3D objects especially a fuji symbol.

Does anyone have the 3 Antic CAD-3D Collections that they would be willing to
share? These have the letters PD in the product code, are public domain,
and may be freely distributed.

The Font and Design disks are not PD but I would appreciate a detailed
list of the objects on them since the catalog and packages are very vague.

Does anyone have any PD/Shareware tools or accessories for Cyber?
How about a list of STart/Antic magazine-disk programs?

3443. Spectre GCR or Mac Classic?

Newsgroup: comp.sys.atari.st
Date: 1990-11-20 18:10:25 UTC
From: mg20+@andrew.cmu.edu
Message-ID: <kbGL6Fy00VIF1Vq1JX@andrew.cmu.edu>
Source record: 237063

Greetings fellow Atarians.

I have to take a computing course here at CMU next semester (gee, what a surprise. A computing requirement at CMU?). Anyway, since I'm taking the Humanities (read: watered-down) version, most of the course will consist of programming in Hypercard. I have been toying with the idea of getting a Spectre GCR for a while now, because everyone here uses Macs --and I like them :-)

However, my university offers *LARGE* discounts on Macs. I can get a Mac Classic with 2 Mb Ram, 40 Mb hard drive, and keyboard for $1120 plus 6% PA sales tax. ($1187.20)

The GCR route is appealing to me, since it enables me to keep my beloved 1040ST (along with its 12" color monitor-- beats hell out of 9" B&W.) But, it's almost as costly. Summation:

Spectre GCR: $219 (cheapest I've seen it)
Mac 128K Roms: $129 (ditto above)
Expanding ST to 2.5Mb: $270 +tax (have to, Hypercard is a memory hog)
Atari Monochrome Mon.: $159 +tax (again, cheapest I've seen it)

Total: $820 (includes tax + shipping of GCR)

If I sell my ST & stuff, I can get $650 (I figure.) So, the actual cost of the Mac Classic drops to $537.20, plus it has a hard drive, and will run *ALL* Mac software (yeah, I know, the GCR is getting pretty good, but I run some weird software.)

So guys, WHICH IS THE BETTER DEAL? I am loathe to sell my ST to buy a virtually identical (and in some respects, inferior) machine. I will get a Mac IIsi next academic year, but I need a Mac *NOW*.

Hugh suggested in email that I post a part of the discussion he & I have
been having re: Neocept. (Does anyone at Neocept read comp.sys.atari.st?)
Here is the main part of our discussion. It may have general interest to
this group. I'd be interested in hearing if others of you have had similar
experiences.

hugh> I bought TurboJet from Neocept a little over a year ago.
hugh> In a random order, here are some points of interest.

me> I ordered mine at the end of June. Neocept moved offices (?) sometime in
me> the summer, and didn't get around to mailing my order until late September.
me> In the meantime, I moved from Oregon to Colorado in August. I left a message
me> on Neocept's answering machine, informing them of my move, and expecting
me> to see my TurboJet in early September. I didn't receive it until mid-October.

hugh> - I have an HP LaserJet IIP with 512K RAM (and a 1Meg 1040STF)
me> I have an identical setup. I'm (er, would have been) running MSWrite as a
me> word processor.

hugh> - I picked TurboJet since the people at Migraph claimed 1Meg of
hugh> printer RAM was required while Neocept claimed that 512k would
hugh> almost always work (I queried both by phone). I also read a good
hugh> comparitive review in ST Informer.

me> Me too. And it was $10 cheaper from the sources I checked, including the
me> mfrs.

hugh> - I did not need WordUP to unpack the disk.

hugh> Could you tell me what has changed with the TurboJet distribution?
hugh> In particular, in what way is WordUP required?

me> Now, THIS is where the main change occurred. I only got ONE disk. When I
me> looked at the disk directory, I expected to see the typical font/driver
me> filenames you expect with GDOS stuff. Instead, there were 4 or 5 filenames
me> that gave no indication of being for GDOS.

me> The documentation mentioned *two* disks, but the README file on the disk
me> indicated that the disk contained an "install"-type program that would
me> unpack the files and put them in their proper places. The real STINKY thing
me> is that the "install" program was not a stand-alone, but it ran from inside
me> WordUP.

me> When I had ordered TJ, way back in June, the printed information I had
me> received from Neocept said that TJ was just what I needed for MSWrite, and
me> that it would work fine. I kind of feel like someone's playing bait and
me> switch with me, and they're holding onto my money as leverage. (Yes, they

me> cashed my check. IN JULY.)

hugh> - I *think* that the second disk (of two) came with a virus!...

me> Yow! Well, it won't do any good to send it in for a refund. They'll
me> probably "upgrade" your TJ for you, and you'll be stuck where I am.

hugh> - The driver usually works, but I have a lot of GDOS problems. I
hugh> don't think they are TurboJet's fault.

me> Okay, we'll give them the benefit of the doubt. I had previously only heard
me> good things about Neocept; I was (trite phrase, sorry) shocked and dismayed
me> to receive treatment like this from them.

hugh> + MSWrite misbehaves in some cases.

me> :-) Well, that ain't GDOS or TJ. That's MSWrite.

hugh> I read on usenet that the address of Neocept changed recently...

me> Yep. And they're still unresponsive. I mailed them a "dissatisfied
me> customer" letter, including everything I've told you, on October 31. no
me> response. I think I've been more than patient.

Actually, I wish Neocept had just given me
what I ordered, and not gotten me caught in the middle of this.
I didn't want WordUp, just the GDOS stuff.
I've been recommending Neocept all along on the net and anywhere else,
and now I realize that I've been steering people into trouble.
I wanted to have a word processor my wife could use without getting
frustrated or having to do any more than load one disk. Now my wife's
mad at me, I'm $40 poorer with nothing to show for it, and who knows how
many other people are in the same situation. Unless someone has
a better idea, legal action is next.

So it goes. If it's a game machine only, mebbe they're saving the cost of the keyboard and it's associated hardware - keyboard processor, clock, and joystick and mouse and serial ports. Probably also remove any floppy drive and controller, so who knows, they could shave the cost down.

Of course, if it's only a game machine, then it isn't really a "suped up" STe. That was the point I was trying to make. The STe is a REAL computer, not a toy!

3447. My poor 1040st

Newsgroup: comp.sys.atari.st
Date: 1990-11-20 19:54:27 UTC
From: selick@bucsf.bu.edu
Message-ID: <69042@bu.edu.bu.edu>
Source record: 237067

Well, my trusty 1040st died 2 nights ago while downloading a 600k file from terminator.cc.umich.edu. I mean...really DIED. Here's the story: I had just finished downloading almost 600k from the telecomm directory (I forgot the name...) and I was running lharc on it. It unarc'ed the first file, and was on the second, when I got about 10-12 bombs. I re-booted the system, and got three or 4 random pixels on the monitor. I turned it off for 10 seconds, and then back on, and zilch. Not even the internal floppy drive will spin the way it did. I took the machine apart and pushed in all of the chips in sockets, and unplugged all of the connections and re-plugged them again. Nothing worked. Any ideas on what happened? Anyone know somewhere in Boston that repairs atari's? or NJ/NY? HELP! Also, in the off chance that my st never works again, when will the TT be coming out, and for how much?
later,

Steve Selick <selick@bucsf.bu.ed> or <engcyjc@buacca.bu.edu>

3448. new uploads to atari.archive

Newsgroup: comp.sys.atari.st

From: millert@tramp.Colorado.EDU
Message-ID: <30066@boulder.Colorado.EDU>
Source record: 237068

I just uploaded the following files to atari.archive.umich.edu
They should be appearing in the atari/newitems directory "real soon now"

azt.lzh :: virus checker that saves will tell you if your disk has been
modified since you ran azt last.
backup12.lzh :: an HD backup ver. 1.2. Does file backup in TOS format.
bellum.lzh :: galaxian type game. Color
blaster.lzh :: defender clone. Color
blockade.lzh :: Alien Blockade. Similar to QIX. Color
cons_fix.lzh :: fixes screen messup caused by some verisons of Quick ST and
Turbo ST when used with Gemini, Rufus and others.
cpanel.lzh :: enhanced control panel.
disk-bar.lzh :: a little bar appears at the bottom of your screen when a disk
is being accessed.
filestuf.lzh :: do batch commands during bootup. For AUTO folder.
floormt2.lzh :: disk formatter. Low rez only (ie color)
fly_ex.lzh :: flies on the desktop... Swat them!
fuzzball.lzh :: Good Q*bert clone
gilgalad.lzh :: Game sort of similar to gauntlet. Mono only
gramslam.lzh :: Working demo of a grammar checker.
gszrz17.lzh :: Gem sz/rz ver. 1/7 (zmodem)
hdx301.lzh :: Atari Hard driver & formatting utils ver. 3.01
james15d.lzh :: _Great_ control panel replacement with mouse accelerator and
screen blanker, drievr speed control and much much more.
Working demo.
menumast.lzh :: Menu Master. A menu program.
msa103.lzh :: Magic shadow archiver ver. 1.03 to make and unpack .msa files
newicons.lzh :: replace the boring file cabinet and trash icons as well as
some alert box icons. nice...
ocultar.lzh :: demo of a password protection prg.
orbit.lzh :: Arkanoid clone done with STOS. Color
pengo.lzh :: clone of arcade game pengo.
rufus102.tos :: great term prg form Germany. Self-extracting archive
stmiror2.lzh :: hard drive util that makes copies of your drive's FATs and
can restore them if they get munged.
supvkill.lzh :: virus killer that can also restore several comercial boot
sectors and write some custom boot sectors as well.
tads.lzh :: Text Adventure Developement System. Write you own text
adventures in a C - like language. Comes with compiler.
treesavr.lzh :: text file printer. Prints two pages accross on each page
to use half as much paper. For epson printers & clones.
working demo.
virusdie.lzh :: Virus killer with animation! (color only)
zmdm618.lzh :: sz/rz, zmodem from dsrgsun

```
img2view.lzh :: viewer for .img files
neodemo3.lzh :: demo of neodesk 3.0
rtvmse.lzh :: recover the mouse pointer when ill-behaved programs munge it
with this acc.

And... I uploaded the files below a little while ago...
They are currently in the newitmes directory.

andro.lzh :: Andromeda Paint from Germany. Works OK in mono, but probably
not with US color monitors unless you change frequency.
a2lswtc2.lzh :: arc to lzh switcher ver. 1.02
cb_paint.lzh :: Color Burst Paint II v. 1.2 (color only)
cts_zmdm.lzh :: sz/rz (zmodem) that uses rts/cts flow control.
fcpy_iii.lzh :: Fast copy III disk copier/formatter
fstlzh28.lzh :: Another version of lharc
idle_22.lzh :: nice screen saver with corner clock and bouncing fuji
lzh11308.lzh :: lharc v. 113 with some C code replaced with assembler
for added speed. A little faster than lharc 1.02
pinhed18.lzh :: Pinhead 1.8 to speed up program loading
pyrosav3.lzh :: Seems to be a newer version of the pyro screen saver
Includes a little utiltity to configure the time limit.
qmenu2.lzh :: Quick Menu 2, a simple menu system.
rampls12.lzh :: Ram Plus 1.2 ramdisk/print spooler/mouse accellerator/screen
saver and more. very nice.
risk_eng.lzh :: English versaion of Risk
skates.lzh :: Skate Tribe. Colro game made with STOS
the_acc.lzh :: The accessory that does it all. Includes modula 2 source

well, that about does it for now.
Oh, to get the help file for the mail server (if you don't have internet access)
send mail to atari@atari.archive.umich.edu with a single line.

>I would like to see gemini1.2 (in german) on atari.archive. Does it
>still require TOS>1.0 and at least 1meg? I have neither (just a poor,
>broke college undergra)!

Ditto... sorta.

>P.S. Anyone have a 520STfm with 1040motherboard they wanna sell???!

This seems like a reasonable article to follow up on.
(I never seem to catch replies to my articles... HELLOOOO? anyway...)

I have a few questions:

1) Sound ceased to come from my sc1224 while I was playing BLOOD MONEY...
and I had a TWEETY BOARD installed. Is this common? My power supply
was giving me flaky power and it was on its path to death...

When I took the TWEETY BOARD off the sound chip, the sound returned
to the sc1224 (Sorry, but I'd rather have the sc1224 sound than the
TWEETY).

2) My power supply finally died so I couldn't test any more variations
with the TWEETY BOARD-- even though the sound worked correctly for
about two weeks before it finally died all the way... well, all the
way except for some awful buzzing.

Does anyone know of any method of getting a power supply for less
than $85?

3) I'd like to try the blitz copy thing once...
I now have a 1040stf with JUST a bad power supply...

I was wondering, is it possible to use the internal drive as an
external (or 2nd) drive for my new 1040stf ($325 w/TOS 1.4)?

>recognizes both Apple HD schemes.

My original question was something like "is it possible to interchange a SyQuest cart with Spectre and a real mac. Dave Small points out in one of the Gadgets newsletters that the Supra formatter works, but I haven't tried this. However, the "CMS Formatter" will work, when used on a real mac. I used this program to format a SyQuest cartridge on a real mac and then I could boot Spectre (2.65) from floppy (after booting the ICD software from floppy) and Spectre could see and use the Mac cartridge. The drawback to this is that you must boot Spectre and Host adapter stuff from floppy, since the CMS formatter won't do partitions, and I haven't yet found any software that will allow me to format a cartridge with an Atari and a Mac partition that is usable on both a Mac and an Atari w/Spectre. It's great to hear that Spectre 3.0 will read other Mac formats. Will it be possible to use cartridges with an Atari partition on a true Mac now? I have seen some partitioning software for the Mac, but will it be possible to partition a cartridge on a Mac and then format/initialize one of the partitions for Atari use?

Many thanks to Suthi (AKISUJAR@NUSVM.BITNET) for pointing out this solution!!

3451. STadel and/or <fnord>adel

Newsgroup: comp.sys.atari.st
Date: 1990-11-20 23:35:42 UTC
From: lodzins@pilot.njin.net
Message-ID: <Nov.20.18.35.41.1990.18446@pilot.njin.net>
Source record: 237071

Does anyone have a version of STadel and/or <fnord>adel that can be run as a door from within ///Turbo Board or FoReM ST? I know Citadel-86 for the IBM can be run this way. The only thing I can see that needs to be changed is so the program (STadel/fnordadel) doesn't try to initialize the modem or hang up when a user Terminates. When a user terminates control should be given back to the calling program like any other (I should say any other) door program does. Also an option to pass the baud rate to STadel/<fnord>adel would be nice. If anyone has any information on this please let me know.

Message-ID: <7340037@hpfcso.HP.COM>
Source record: 237072

>I am about to purchase a Stacy for use use with some music projects of mine.

I got some answers, although a few more phone calls are what got me most of my information.

>1. Spectre GCR and midi.

No word on this still.

>2. Laserjet output from music typesetting software.

Dr. T's laser output is not all that much better than EZScore's dot marix.

There is a package in the UK called "Take Controls Music Publisher".

Encore, a Mac program, has been ported to the ST, and it seems very full featured, although it doesn't have tightly integrated sequencing as does Dr. T and Notator. Still no word on whether Notator supports Laserjet's yet - their tech support guy hasn't called me back.

>3. Can you use an accelerator in the Stacy?

Yes, Turbo16 from Fast Technologies.

>4. What about this rumored third party battery pack?

No word here.

3453. Falcon Strangeness

Newsgroup: comp.sys.atari.st
Date: 1990-11-21 01:47:06 UTC
From: eahsnsr@nmt.edu
Message-ID: <1990Nov21.014706.599@nmt.edu>
Source record: 237073

I just bought Falcon 1.1 for my unmodified 520STfm, and I have noticed some strangeness. Disk 1 loads fine, but when it asks for disk 2, my disk drive keeps spinning, yet the drive light goes off. On top of this, if I do insert disk 2 at that time and press space like it says, it won't load. In order for it to load disk 2, I have to take out disk 1 and press space with no disk in the drive. After about 10-15 seconds, it asks again for disk 2. When I put it in this time, it loads fine! I have also noticed that the disk drive keeps making a spinning noise even though the drive light is off. It keeps doing that until I get to the actual cockpit screen. What Gives?

Has anyone else experienced this? Does anyone know why it does this? It is very irritating.

>| JANET :- ADM2@DOC.IC.AC.UK | |
>+---+

The program of choice here is Digispec. I believe Alpha Systems sells it. It will take a .gif file and convert it into a .sps file (spectrum 512). It will then look about as good as it can on the ST (it takes some time to process each picture). The resulting .sps file is usually MUCH smaller than the original .gif. There is a PD viewing program available for .sps files which also can compress them into .spc files (I may be backwards about .sps and .spc, now that I think about it!). Anyway, if cannot find an add for this company, send me email and I will dig it out. Oh, I checked out a couple of PD .gif file viewers, and none that I saw even came close to the job that Digispec does. Usually, .gif files are scanned in at a resolution (and with more colors) than the ST can display. Thus, any viewing/converting program must convert the file the ST's resolution, and reduce the number of colors to 16. Digispec converts them to have 512 colors, which really makes a difference! All the PD programs I have seen use only 16 colors, which is what the ST was designed to display in low rez (16 on the screen at one time). Hope that helps!

I AGREE.

Goodness, the only thing I use my ST for is Turbo C programming, which is the only program I find an actual JOY to run on the ST.

Anything else, if I didn't have my Mac emulator....I DON'T KNOW WHAT I WOULD DO...probably drool all day long at PM 4.0, Word 4.0, Mathematica, VersaTerm, Finder....GOD what would we do without Finder???

--Gregory

PS: I WOULD run this stuff NOW, but I don't have my MEGA that I ordered OVER 6 weeks ago!!!

What the hell is going on? Its Xmas shopping season and Atari doesn't even have anything to sell??? Thats F'ed.

3458. Mega ST2 for sale

Newsgroup: comp.sys.atari.st
Date: 1990-11-21 05:58:19 UTC
From: <>
Message-ID: <274A177B.9879@orion.oac.uci.edu>
Source record: 237078

The following Atari computer system is for sale, plus additional
accessories and software.

The following list is of all the Atari made products (Still have
the original boxes):

Mega ST2 68000-8MHZ.
2 MB of RAM.
1 3.5" 720k drive.
30MB external hard drive.
Mega ST Keyboard.
SC1224 color monitor.
SM124 monochrome monitor.
SX212 1200 baud modem.
ST Mouse.

The following is a list of additional peripherals and accessories:

BEST Mouse: Ergonomic design and longer cord.
Moniter Master: switch between color and monochrome with a push of
the button. Has RCA output jacks for video and audio. Hook
to external speakers.
1 monitor stand.
1 Suncom Slik Stik joystick
1 Suncom Tac 3 joystick

All the software that is listed contains all the original
documentation and boxes(if the software came in one):

NEODESK 3.0: The ultimate desktop for the ST.
Split Windows: see two different parts of the sane directory.
Desktop Notes: write notes on the desktop, and save to disk.
File Clipboard: expanding and contracting ramdisk.
Independent Windows: Each window can display icons or text
seperately.
Folders on Desktop: just like the Macintosh OS.
Icon Editor: called right from the desktop.
Macros: automate NeoDesk functions.
Change the system font.
5.25" drive supprt.
Desktop pictures: Degas (un)compressed, Neo pictures.
All resolution support.
Plus much more ...

NEODESK CLI: command line interpreter in a window; good batch file
interpreter, utilizes NeoDesk file functions.

LASER C Compiler: includes,
mouse-based multi-window editor, disassembler, make utility,
resource construction program, egrep, UNIX compatible
routines, RAM cache, debugging facilities, GEM documentation.
GFA BASIC 3.0 Interpreter.
WORD WRITER: word processor; spell checker and thesaurus.
SPECTRUM 512: nice painting program; show all 512 colors at once.
(Throw in lots of converted .gif pictures)
UTILITES PLUS: Many disk utilities for the ST.

The following games come with original documentation and boxes:

BARBARIAN: great sound and two player mode.
BARBARIAN II: sequal to above; great graphics and sound (3 disks)
(I've got map of the different levels)
BATTLE CHESS: watch the pieces fight it out in 3D; great graphics
and sound; play computer or over the modem; runs off the hard
drive.
CHESS PLAYER 2150: Best chess program for ST; easy to see 3D
board; adjust level of difficulty; choose type of pieces.
CRAZY CARS: car racing game.
ENDURO RACER: good adaptation of arcade game.
POPULOUS: play a god and let your people flourish; good graphics;
play against computer or over modem; awesome game overall.
RAMPAGE: play a monster, destroy cities and eat people.
WIZBALL: bring color back to the land; good graphics; 1-4 players.

I also have the followin PD and Shareware programs:

UNITERM: good telecommunication program.
OPUS 2.2: spreadsheet.
MICROEMACS 3.10: text editor.
DL II: hard drive utilities; defragment hard drive.
DCOPY320: fast dearcer and arcer, mouse driven shell.
UNLZH 1.72: uncompress .lzh files.
ZOO.TTP: extract .zoo files and compress files in .zoo format.
PLAY: play random digitized sounds during boot up.
CLICK: assign digitized sounds to your keyboard.
NEWBELL: replace the bell with a digitized sound.
FATSPEED: accelerates disk access time.
PINHEAD 1.7: accelerate the execution of programs.
VKILLER 3.11: virus killer.
DCSQUISH: compress executables so they still run.

plus much more ...

The total cost of everything is $2700, however reasonable offers
will be considered. I prefer that the whole system is sold
together. You pay shipping.

> blocky and ragged!!

This runs absolutely counter to every experience I have had with Calamus,
GDOS and font technology in general -- and I've been working with typesetters
for 20 years.

Outline fonts are used to create bitmaps on the fly at optimum resolutions,
for each desired point size. PostScript, Calamus, DeskSet II and PageStream's
built-in printer drivers are all examples of outline font technology.
There is considerable variation in the quality, but all are better than
GDOS.

I'm looking forward to seeing the new outline-font GDOS shown at Comdex
last week. The Z*Net report suggests that it uses a PostScript-clone
to generate bitmaps from outline masters.

I've seen output form the new GDOS, which is called FSM GDOS for Font Scaling Module Graphic Device Operating System. The stuff looks REALLY good. It uses the Ultrascript fonts, and it even substitutes fonts for real italics. Uses the same outlines for all devices so what you see will truly be what you get. Finally, it's very compatible with older GDOS programs and it can rotate text to any angle (0-360 degrees in 1/10 degree incrents).

I can confirm the Gemini fonts are in Motorola format. I haven't tried it,
but I've just got Fontkit3+ from the ST Club which should be able to do
the conversion. It's a good thought as it may solve my problem of having
to switch GDOS's for Timeworks as the print fails under AMCGDOS.

3468. HELP !!!! (I'm desparate)

Newsgroup: comp.sys.atari.st
Date: 1990-11-21 13:15:22 UTC
From: e21c10@titan.hts.hsa.nl
Message-ID: <1399@titan.hts.hsa.nl>
Source record: 237088

I have a routine in GFA-BASIC, which is calculating the determinant value
of a matrix. Since this routine is called many times in program execution,
I've written the routine in C, supposing there was some way to use a
compiled C program in GFA BASIC (V3.0).
Well, yes : Gfa basic has such a command (called 'C:(params)') and
no : It doesn't work.

So I made up a small test-program to see how C is used in GFA-basic.
The program :

```
adres = MALLOC (2000) ! Reserve 2kbytes of memory
BLOAD "A:\CPROG.PRG",adres ! Load compiled C in reserved memory
VOID = C:adres() ! Execute c-program, in this case no parameters
VOID = MFREE(adres) ! Release reserved memory.
```

The C-source of CPROG.PRG

```
#include <stdio.h>

void main ()
{
printf ("This is a C-Program")
}
```

Well, this doesn't seem to work either (although it looks nice, isn't it?)
GFA basic returns the error message '3 Bombs - Wrong peek or Poke'.
Studying the (executable) code of the C program, I noticed that in line 2
of the code the following command is given :
MOVE.L $2000(PC),$0000174.
questions :
1 Is this writing in the zero-page
2 Can this only be done in SUPERVISOR-mode ?

If the answer at 2 is 'yes', then what can I do to get the computer into
SUPERVISOR-mode ?

If you have any solution to this problem, PLEASE post it
(Or mail me !)
Bye,

I believe I have an Okiemate 20 plug -n- print module for an Atari 8-bit computer... so if you want the okiemate 20 color printer, you might give me a hollar! Unused, still in the box. $5 plus shipping... your choice on the shipping.

My program, GIFSPC, and BGIF (sorry, forgot the author) will both use up to 512 colors when converting from GIF to Spectrum. From what I can tell, it looks like BGIF only uses 16 colors per scan line, whereas GIFSPC will use all 48 allowed if it can. (Anyone know for sure about that?)

If you can't get GIFSPC through anonymous FTP, I'd be happy to Email it to you.

>...Bottom line: The time to write data to disk is only one side of the coin.

> Dipl.-Inform. Rainer Klute klute@irb.informatik.uni-dortmund.de

I agree, but disks are relatively cheap; I'd rather spend $10 for an extra
set of 10 disks and have the software write at full I/O speed than save the
$10 and have the backup take an extra 30 minutes while it saves me two disks
in compression...ideally, the compression scheme can quickly sense whether
the file is likely to be compressed much (ASCII, non-compressed graphics
data) and implement a quick, reasonably efficient algorithm (lempel-zev
would take too long to do on the fly). If the first few hundred bytes of
data are fairly random binary then skip compression...the 10-20% savings
aren't worth the time it takes to compress.

I used BackupST to back up my drive and I'm quite happy with the results.
I do have a couple of suggestions for enhancements:

1) An option to verify the backup would be nice (in the same menu as
list/backup/restore) - slightly more security than having write verify
on, and doesn't take much longer.

2) A screen after the backup listing total bytes backed up/restored,
total files/folders, Mbytes/minute, and any other pertinent or
interesting data.

3) (If not already present) some error-correction data added to the
backup to allow recovery in the event of a few bad bytes on the
backup media.

Please don't take these suggestions as criticism; the program is superb as is.

In article <36073@cup.portal.com> Henry_Burdett_Messenger@cup.portal.com writes:
>Compression should never, ever be used in backups...
>
>Henry B. Messenger

I disagree. How about "Compression should never, ever be used in backups
*** for which the lowest possible chance of non-recovery is needed ***."

My prior experience says that I (personally) am not too likely to accidentally delete files/kill my hard disk, nor have equipment failure resulting in loss of data. Prior experience also shows a very small chance of a floppy backup being corrupted. The chance of both of these happening is therefore miniscule. (Again, I'm speaking solely for myself and my own level of risk tolerance). Therefore, I would not be uncomfortable with the slightly higher degree of risk imposed by using compression on my backup floppies.

I agree that the option for non-compression should be available, and that for any files/data which I must be certain is as secure as possible that I should use the safest backup method possible. But leave that option up to the user.

>featured, although it doesn't have tightly integrated sequencing as does Dr. T
>and Notator. Still no word on whether Notator supports Laserjet's yet - their
>tech support guy hasn't called me back.
>

I have left several messages with the people at Passport Designs trying to
get information and a demo of ENCORE for the ST... all i get are machines
and answering machines and so on... no one calls me back...

I have been using NOTATOR for over 2 years. But the one MAJOR flaw with
the program has finally forced me to get into something else... if not
to change over to a MAC and FINALE.

Problem: with NOTATOR, one can NOT (unless someone can correct me on this)
display MORE than 2 independent voices on a SINGLE staff. This is
absoulutely necessary for scoring classical guitar. NOTATOR provides
for 2 independent voices for each staff in a grand staff display. This
works wonderfully for 4 part chorales... but when you get into
more complex piano scores (over treble and bass clef) or into
multi-voice guitar parts on a single treble clef, you are f'ed.
FINALE for the mac allows this. I would rather invest in ENCORE
than change platforms, if ENCORE will do what i need on the ST..
i'll keep NOTATOR for sequencing and use ENCORE for publishing.
Otherwise I'll have to go to the MAC and wrestle with a ridiculous
user interface : FINALE's, just because of the one factor.

I spoke with Mikhail .. the US rep for C-LAb about this several times.
He states that it is very unlikely we'll see an update to NOTATOR
for another 8 months or more... and that "my" problem had never been
presented to him before.. that if only a few people see the need for
the "fix".. it won't be done.

BTW: My GCR supposedly will run FINALE.. but, of course, not run
the midi functions. Since i have an older 1040 4MB, the new
Megatalk board by Gadgets won't due me any good.

>--
> -- Howard Chu @ University of Michigan

I've seen the same thing (with the double mono screen - a cheap two-page monitor!) This happened when I was using a multisync in mono mode - overnight I turn off the monitor but leave the ST on - when I came in the next morning and turned on the monitor I saw what you describe. I suspect it has something to do with the synchronizing circuitry in the monitor becoming confused (in my case, when I turned on the monitor with the ST already on). Perhaps your ICD driver/STe is pulsing the horizontal sync in such a way that the monitor gets confused...

3477. discounts at schools

Newsgroup: comp.sys.atari.st
Date: 1990-11-21 20:01:55 UTC
From: tellabs.canada@canrem.uucp
Message-ID: <1990Nov21.1113.4059@canrem.uucp>
Source record: 237097

Earlier someone posted stating that Atari should promote its student discounts (which do exist, as was also mentioned in the post) at music schools by donating equipment, etc.

This seems to have been done by Atari at Fanshawe college, London Ontario. A cousin of mine has often mentioned the large number of Atari's being used by students. ST's in music production labs, etc.

My feeling on the subject is the same, it would be nice if Atari made students aware that they did this. WHat use, after all, is a student discount program when nobody knows about it?

3479. Re: GIF format ?

Newsgroup: comp.sys.atari.st
Date: 1990-11-21 20:39:10 UTC
From: rlee@weaver.ads.com
Message-ID: <RLEE.90Nov21123910@weaver.ads.com>
Source record: 237099

In article <647@fsucs.UUCP> boyd@fsucs.UUCP (Mickey Boyd) writes:

|The program of choice here is Digispec. I believe Alpha Systems sells it. It
|will take a .gif file and convert it into a .sps file (spectrum 512). It will
|then look about as good as it can on the ST (it takes some time to process
|each picture). The resulting .sps file is usually MUCH smaller than the
|original .gif. There is a PD viewing program available for .sps files which
|also can compress them into .spc files (I may be backwards about .sps and .spc,
|now that I think about it!).

A few corrections: First, Digispec is from Trio Engineering, the
creators of Spectrum 512, and costs ~$40. Its primary purpose is for
use with their digitizer; gif conversion is an add-on. Second, it will
let you save the result as either an _.spu_ or an .spc file, the latter
being the default. Every Spectrum viewing program I've seen will work
with either of these. Sps is a more compressed representation,
apparently _not_ developed by Trio; .sps files require spslidex (PD) to
view or convert, I'm told.

Digispec does indeed do a better job, not surprisingly, than the PD
converters Bgif and Gifspec. The picture quality is better, the files
are smaller, and you can adjust brightness, contrast, color mix, and
dithering scheme as desired. On the down side, it cuts the top or
bottom (your choice) off of tall gifs, and it screws up the aspect ratio
on the most un-square gifs.

I've seen enough questions on this issue (including my own, a few months
ago) to think there should be something in a periodic FAQ posting on it.

3482. My Neocept/Wordup Story.

Newsgroup: comp.sys.atari.st
Date: 1990-11-21 22:24:39 UTC
From: econadm5@watserv1.waterloo.edu
Message-ID: <1990Nov21.222439.6978@watserv1.waterloo.edu>
Source record: 237002

About a year ago I saw the full page ad in STart for WordUp v3.0. It promised wonderful things, including importing Wordperfect files and editing math equations. Wow, I thought, an alternative to Wordperfect that will be supported and offers more features!! Boy, what a fool I was.

I bought v2.0 as the ad suggested. It promised v3.0 by Feb. 1990. I waited 7 months for v3.0 instead. I waited 3 more months for Disk #1 to be "fixed". When Disk #1 finally arrived, Neocept asked for Disk #5 and a stamped self-addressed envelope...they had to update the printer drivers. I thought this was sleazy...but I didn't want to be a "whiner" <grin>...and I did want a nice, working word processor. So I sent an envelope, a short note and 75 cents in US coin taped to the disk. (In Canada you cannot buy US stamps. Two disks had been mailed to me from California for 75 cents, so I figured that was more than enough for 1 disk.)

Two months later (last week) the envelope arrived rubber stamped with "Return for Postage". The disk had not been updated AND the 75 cents was ripped off...with bits of tape left behind!! How cheap and inconsiderate can one be? I have phoned Neocept twice in the last few days...no answer. (I tried 805-484-2041, and the operator gave me 645-5666 to try.)

I have waited almost a year for a usable word processor. I think it is reasonable that my patience end. This is bulls**t customer service. I have returned the package to my dealer. My dealer had no obligation to look after Neocept's incompetence, but he offered to look after his customer.

WARNING TO ANY NEOCEPT EMPLOYEE: Do not come to a show in Toronto or Windsor/Detroit area. You might meet an
angry fellow.

Source record: 237004
Cross-posted to: misc.forsale.computers,comp.sys.atari.st

Sorry to waste this bandwidth. My Atari 1040ST has been sold with everything except the hard drive, which is still for sale. Chris Russell (wherever he is - I never got mail from him after he called - give me another call if you read this and are still interested, Chris) has first dibs, though. I'm trying to get $300 for the hard drive, which is a 30 meg Seagate in a large case with room for three more drives. It's big and kind of loud if you don't muffle it, but it has been completely reliable for three years and will work with either an Atari ST or a Mac. I'll include all the information I have/used on building hard drives as well as spare hardware such as cables and an extra controller board.

Email is preferred...

My friend brought me back a few flyers from Comdex. One of them
is for a product called FontVerter. Apparantly it converts fonts between
Calamus, Pagestream, and Font Designer. Address of the company is:

MegaType
P. O. Box 645
South Bend, IN 46624
(219) 288-7468

Price is $49.95US.

I have no relation or affiliation with the above company or
mentioned products. Hope this is helpful.

Message-ID: <1990Nov22.092834.10478@daimi.aau.dk>
Source record: 237007

About the problems with GCC reporting file not found:

Last night I was succesfull in getting my gcc to compile hello.c.
I'm using Gulam and a version of GNUC that I think is identical to
the one on atari.archive.

My environment setup is as follows:

GNUINC = /gnuc/gccincl/
GNULIB = /gnuc/gcclib/
GCCEXEC = /gnuc/gccexec/gcc-
TEMP = /temp/

The folder 'gnuc' ordinary path is 'd:\gnuc\' and temp has
'd:\temp\'.
I think what has gone on is that GCC takes a path to be relative
to the root directory, not knowing the d: drive specification.
The result is that GCC can't find the preprocessor, even though
it reports $(TEMP)/cc100000.cpp as the one missing (a bug perhaps?)

I haven't done any much testing, so I don't know if there is an easy way
to distribute the files on several drives (e.g. by using /dev/C/).
I know however that the slashes at the end of GNUIC, GNULIB and TEMP
can be dropped.

DON'T USE Gemini 1.18! It have been one of the Beta-Test versions,
about 20 releases from V. 1.2! It definitly includes some bugs which are
corrected in version 1.2, and, like Karsten I. said, it's like piracy!

Apart from this, ther are many new features in th new version:
- programs can be loaded as 'overlays', so Gemini does not stay in RAM
- DA-communication-port, messages can be exchanged between Gemini and
the desk-accessories
- advanced CLI (mupfel) - features, like pipe, for, manual ....
- and Gemini comes bundled with some realy nice and usefull applications:
- treeview: shows the directory-tree in a window, communicates with
Gemini, so you can click on a path in the tree and Gemini (!)
will open a windo for it.
- chameleon: is able to load, install and de-install DAs, and it may take
a acc-name as command-line, can you imagin what this means?

But, i'm not the one to tell you.

Message-ID: <sent.Thu.Nov.22.13
Source record: 237011

Anyone like to tell me what the prices of ST's and Macs are in USA?
I'm doing a comaprison of UK and US prices of the following :

520STFM (basic model) - uk price is about 299 pounds
Mega ST2 - about 800 pounds in UK.
SLM804 laser printer
Mac Classic
Mac Classic with HD

The US prices of these models would be greatly appreciated.
Especially as the pound = $2 at the moment :-)

Is the assembler AS68 the same as Alcyon? If not is it available
anywhere for ftp? In other words, where can one find it?

Thanks,

3493. Re: TeX 3.1 and Metafont also running on Atari ST

Newsgroup: comp.sys.atari.st
Date: 1990-11-22 22:03:11 UTC
From: ridderbusch.pad@nixdorf.com
Message-ID: <RIDDERBUSCH.PAD.90Nov22220311@ugus21.nixdorf.de>
Source record: 237013
Cross-posted to: comp.sys.atari.st,comp.text.tex

Hi out there.

Two days ago I posted a message, that said, that the recently announced web2c version 5.8a for TeX 3.1 and Metafont 2.7 also works for the ST. I'm afraid I was a bit to fast in saying so.

I posted the article after just having finished a final cross recompiling of Metafont in the good spirit that it would also work on the ST, since TeX and most of the utility programs I tried, seemed to work okay. (If I can say that without running the trip test. Several document I run through TeX came out okay).

But sadly I made the experience, that Metafont wouldn't work correctly. Inimf produces a dump of its interna. That works okay. Virmf seems to be the problem. Virmf reads the dumped image correctly, but before the first character of some font is generated, virmf aborts with a "Bad culling amounts" error.

So, I have to say, that Metafont needs a little more debugging.

I'm very sorry for being a bit over enthusiastic and maybe getting some hopes too high.

I just purchased PC-Speed. However, I use just plain Super Boot to boot
into any ST program or DOS program. For DOS I just tell superboot to
boot the PC_SPEED.PRG program, and then make the AUTOEXEC.BAT file on
my DOS partition an "OTHER" file in SuperBoot. So I have several customized
AUTOEXEC.BAT files in a DOS directory on the DOS partition. The last thing
each customized AUTOEXEC.BAT file called is the program that I want to
start executing in DOS.

The $15 registration fee is probably much less expensive than the Talon
Technologies program. So for those less classy and less well off people
like me SuperBoot remains a good working solution in lue of a probably
fully featured classy Talon program.

Just a simple question after I put out the system specs:
Atari Stacy4 running Mint06 off a D: partition.
How can I get MGR to open a window?
All I get is "Can't get a PTY" when I try this.
I didn't see anything in the docs on creating them.
Thanks in advance Harry

3499. Compiling uEmacs 3.10

Newsgroup: comp.sys.atari.st
Date: 1990-11-23 04:48:07 UTC
From: gaplace@blackbird.afit.af.mil
Message-ID: <1761@blackbird.afit.af.mil>
Source record: 237023

I've been trying to compile the generic MicroEmacs 3.10 sources that I picked up. I'm using Mark Williams C and I've set the st520 and atari flags in the source and I'm using the Mark Williams makefile. Make goes OK until it hits the file st520.c where complains that the variable mousehidden is undeclared. I've double checked the MWC book and mousehidden is a valid command along with hidemouse and showmouse (which by the way are used in files compiled before st520.c and the compiler seems to have no problems with them). I'm running on a 1040 with MWC 3.0.9. Am I doing something wrong? I'd appreciate any help anyone can give me.

>it's version 4.8.4, by the way.

OUCH!

Firstly apologies for including most of the original but I felt deletions
would destroy the sense of Howard's message.

I too have an ICD host adaptor with the same software. However I do not
have STE_FIX and I am certainly not getting most of these problems. The
only one I get is not booting Med-Res if the desktop is saved in Lo or Med.
One *simple* fix I've found is to save the desktop in Hi-res then when
you boot with a colour monitor it comes up in Med.

I believe there is a hardware bug in the latest ICD board. I have contacted
them & they are sending me a daughter board "which will cure it".
Cannot confirm yet as Snail Mail is still doing its worst!! The
problem is around noise on the DMA bus. To see if you have this problem,
turn on write verify. If it reports error, you probably have read errors
also. A short term fix is to find a DMA lead which allows the disk
to write without error but it will vary from drive to drive. This

may be the cause of your other problems - no promises though.

John.

From: herbert@tubkom.UUCP
Message-ID: <1288@tubkom.UUCP>
Source record: 237028

Hi,
we are using the xwindow software of Atari Germany and have also some experiences with different prereleases since december 1989 (delivered by X software, the developer).
Configuration:
Atari: Mega ST4, BioNet 100 II - LAN interface, SM124 monitor
Hosts: HP9000/3xx systems
The software is reliable, the performance fast/acceptable (don't compare it with a SPARCstation).
Problems: Sometimes we do have problems with our LAN (campus net). If we have a lot of garbage on the net, the system becomes instable (n bombs, reset required). But this happens only arround 5 or 6 times a year.
Remarks: The Atari side offers only TFTP (trivial ftp, UDP based), but you can use FTP (reliable transfer) if you start file transfer on the host.
The transfer rate (filetransfer) is growing from relase to relase. Now: 10-20 kByte/s. We expect further improvement, because we know, that transfer rates above 50 kBytes/s are possible. We reached this rate using the tcp/ip software (ftp) of BIODATA GmbH (the vendor of the interface card). BIODATA offers also xwindow software, but I don't know anything about prices, performance etc.

At atari.archive.umich.edu (141.211.164.8) you can find what you need. Get
the file lharc.arc from the directory /atari/archivers.

If you also want a decent GEM shell for all the relevant archivers (Zoo,
Arc, LHarc) get the file arcgsh31 from the directory
/atari/Binaries/volume12. (Hmm, that's not the most recent version but a
new release is in the making anyway. Yes, I wrote it.)

3506. Interest in porting fweb, anyone?

Newsgroup: comp.sys.atari.st
Date: 1990-11-23 15:16:45 UTC
From: petcher@ds10.scri.fsu.edu
Message-ID: <1453@sun13.scri.fsu.edu>
Source record: 237030

I have been using fweb (a version of cweb which can handle C, fortran and ratfor and is being updated to handle C++ and fortran '90) very effectively to maintain self-documented code for a collaborative effort on the supercomputer here, and would love to get it up and running on my ST. I can get both fweave and ftangle through Bammi's port of the gnu C compiler, but fweave crashes mysteriously (due to faulty memory/stack handling?) and ftangle works but crashes after completing its task, I think due to something incompatible in the functions associated with time. The program compiles straightforwardly with gcc on a sun, or a vaxstation or decstation running Ultrix.

Would someone be interested in looking into the problem? I don't know much about gcc and haven't had much time to get very far yet. It shouldn't be difficult for someone who is substantially more familiar gnu C than I am.

By the way, to what extent is gdb working for the ST? I can get it going without problem with a liitle program like "Hello World", even with source debugging, although I haven't checked it extensively. It crashes hopelessly with fweave.

Anyone who is interested, please email me. Or any knowledge of bugs or incompatibilities in the ST gnu port/libraries with standard Unix stuff would be appreciated.

Message-ID: <BAMMI.90Nov23152909@acae127.cadence.com>
Source record: 237021

this is a common problem. it has nothing to do with gcc or UNIXMODE
per se. The problem is due to old versions of zoo, that translates
the '-' (minus) character in a filename to an '_' (underscore) when
extracting files on the atari. rename 'gcc_FOO' to 'gcc-FOO' to solve
the problem. if the problem persists, run 'gcc -v foo.c' to see whats
going on.

cheers,

Make sure the SHELL environment variable is set correctly.
If it still doesn't work, press CTRL-ALT-F1 before trying to create
the window; the resulting trace output will likely tell you what's wrong.

(This is something that should have been emphasized in the MiNT
documentation; CTRL-ALT-F1 is *very* useful for tracking down mysterious
program failures. Pressing the key once gets reports of failed system calls;
pressing it twice gets a trace of all system calls. Use CTRL-ALT-F2 to
cancel the tracing.)

I installed a mail-based file server on my system today. You can request a directory of the available files by sending a piece of mail to st_requests@n6vbg.hamavnet.com with just one line saying *DIR. A brief explanation of the commands will be included.

The subject line doesn't mean anything to the server so you can leave it blank if you wish.

Let me know if you want to make your file available for distribution via this mail server, I'd be happy to include it in the list of available files.

> list/backup/restore) - slightly more security than having write verify
> on, and doesn't take much longer.

Can you be more specific on this point. What would you like to have
happen during this verify. Do everything you do in a restore, except
writing the results to disk?

> 3) (If not already present) some error-correction data added to the
> backup to allow recovery in the event of a few bad bytes on the
> backup media.

The error correcting data is minimal. On every disk is a disk header.
Every backup action has got a random number assigned to it. This
number is stored, together with the disk number on every disk.
Everytime a disk is changed, these numbers are checked. The archive
index, which is vital for a restore action, is stored both at the
beginning of the archive, and at the end of the archive. If neither
of these archive index's can not be read, the archive can not be
restored. In the archive index every file is tagged with a
starting position in the archive and a length. If there are some
bad bytes on the backup media, this file is just skipped. The program
will continue with the next file.

If you have any further suggestions about what error-correction data
could be added please let me know.
>
>Please don't take these suggestions as criticism; the program is superb as is.

Thank you.

3514. TT sold in Germany

Newsgroup: comp.sys.atari.st
Date: 1990-11-24 17:22:44 UTC
From: sarnila@tukki.jyu.fi
Message-ID: <SARNILA.90Nov24182244@tukki.jyu.fi>
Source record: 237040

TT 030 is now available to ordinary customers in Germany. The basic package
includes:
- CPU 32 MHz (not 16 Mhz as in the prereliese)
- 4 Mb ram (all slow ST-ram)
- 68882 32 MHz is included
- Hard disk ST157N-1 46,3 Mb 28 ms
- VGA monitor
- DEM 7298,-

Available memory options (ST-ram+FAST-ram):
- 2+4 Mb
- 2+6 Mb (otherwise as above DEM 7998,-)

FAST-ram can be upgraded to 26 Mb.

Other options:
- 110 Mb, 15 ms, 32Kb hard disk cashe (with 8 Mb memory DEM 8798,-)
- 21" B/W monitor (1280x969) (with above DEM 11298,-)

Other configurations are available.

While price is higher then anticipated, the shift from 16 to 32 MHz,
2 to 4 Mb ram and 30 to 46 Mb hardisk is significant.
Still with 33MHz 386 PC prices coming down the price seems too high.
It is about 4 to 10 times faster then ST. A lot of ST programs (the clean
ones) run as such (Calamus works fast and nice).

Next year the Unix version will have A32/D32 full size VME/Eurocard slot.

I, too, noticed that the VDI cursor control routines are missing from
the GCC GEM libs.

After searching the libs with the archiver and namer, I am now certain
they are not there. At this point, I can only recommend getting the
sources necessary to make gem.olb, and adding the four missing calls
to the ROM code yourself. One day soon, I am going to do this too.

Could someone please explain what is meant by undumped executable?
I was going to ftp Gnuemacs from terminator, but the were two versions -
one labeled undumped preloaded image (executable) and the other labeled
the UN undumped (xemacs, and temacs respectively)
What do these terms mean, and which do I need?
Thanxs,
Jim (mintha@geog.ubc.ca)

3519. UniTerm 2.0e dialer question

Newsgroup: comp.sys.atari.st
Date: 1990-11-25 00:27:05 UTC
From: scoile@gmuvax2.gmu.edu
Message-ID: <2961@gmuvax2.gmu.edu>
Source record: 237036

Lately I've been trying to use Uniterm's dialer, and I'm having some problems. I'll have it dial one number, and if it doesn't connect, and I hang-up, I can't change the number I want to dial. In fact, I can't do ANYTHING (except to get it to dial again, and hang-up). I tried pressing <CTRL/C> as it says in the manual, but it doens't do anything.

Can anyone spare some advice on what to do? As it is now, I'm stuck with rebooting (AAARRGH!). Thanks!

-Steve Coile

Well, I've seen it in low-rez mode now, too. In mono, what happens is the video shifter gets set to medium rez, but lineA, VDI, AES, etc., aren't notified of any change. From low-rez mode, you get the same vertical division of the screen, only this time, the right half is black. It's really strange, I didn't think the way memory was mapped would allow something coherent to be displayed when modes shifted like this, but there's no scrambling at all.

I had those problems, too. It seems that if you keep pressing <ctrl>c,
it will eventually get out of dialing mode. Another option is to leave most
of the dialer setup options blank (retries, timeout, fail messages, etc.).

Hope this helps some.

3523. Copy Protection

Newsgroup: comp.sys.atari.st
Date: 1990-11-25 15:08:40 UTC
From: jimomura@lsuc.on.ca
Message-ID: <1990Nov25.150840.8250@lsuc.on.ca>
Source record: 237046

Looking at the results of the early results of the games survey
a thought crossed my mind and I thought I'd ask about it.

I have had about 11 computers over the years and I currently
own 5 (4 working and 1 burned out). As such I have the luxury of
picking and choosing which programs I'll buy from a wider array
than most people. I've essentially stayed away from copy protected
software -- even in games. It may surprise people to know that although
I don't really play games much, I have bought a fair number. Yet
on a rough guess, over 1/2 the games I have, not including the extremely
short demos in some magazines, are *not* copy protected, and if you
include the short demo programs, a strong majority of my games
are not copy protected. How did this happen?

1. Games that Radio Shack sold for my CoCo and CoCo3 were *not*
copy protected. Nope, none of them. I bought almost all of
the games that came out and they are excellent games at good
prices.

2. Some games for the Atari ST I bought, such as Wayne Gretzky Hockey
were not copy protected. I hope this will be a trend. I
have not really been checking which games are copy protected
but I'm thinking about asking about it in the future.

3. Some of the games I have for the Atari ST came from the magazine
disks. I find I'm fairly happy playing some of these games.
Others aren't so good. An example of one game that was quite
good was "Robotz" in the Sept 1990 issue of "ST Format". This
game would have been quite competitive commercially around the
time PacMan first hit the scene. It's very enjoyable, but
perhaps not something I'd have picked up at normal game prices.
I'm thinking about submitting ratings on the "magazine games"
to the poll since they are becoming a fairly substantial part
of my game software collection.

4. Some of the games I've received online have been legitimate
and workable. So far none have been *good* mind you, but that's
a theoretical possibility. :-) Actually, I've received sources
for Hack variations and discarded them. I like Hack/Rogue type
games, but I have it on the CoCo3 and I don't feel the need
for another one. If I *had* compiled it, I expect it would have
been workable and likely as good as the commercial version of
Rogue I play on the CoCo3. So it's probable that you can be
very happy playing "legitimate, free" games from BBS/Online
sources. Maybe those should be rated in the games poll too?

My feelings being as they are lately, copy protection may be
a good way to ensure that I *won't* buy it. I have substantial
alternatives and will soon be getting another major alternative.
Later this year I'll probably buy a Sega Genesis. You see it's
a matter of not liking copy protected *disks* for me. Disks are
not meant to be permanent media. I don't know why this isn't
understood by some people. The projected minimum latency for a
floppy is only about 5 years. In theory, after 5 years, if the company
has gone bankrupt and you have no backup of a program, you're not
going to have the program at all. I do *not* buy software that I
don't want to keep, so why would I buy software that will "evaporate"
on me over the years? Yes, I really do play old games! That's
why I will not mind buying Genesis cartridges. I've bought a number
of CoCo3 cartridge games as well and will also buy more of these if
they are still around. And no, I won't make "illegitimate" copies
of copy protected software. If somebody doesn't want me to have
a backup, I feel that obviously the person wants to make more money
selling me another copy later, so if other people will provide me
with a similar product and willingly allow me to make backups I'll
simply buy that other product instead.

All in all, if copy protection is a factor in software sales
it might partially be showing up in the games survey. It seems
that not many of us are playing games. To some extent I think
we *all* have a negative feeling to games because we expect that
they are are copy protected. Is this partly what's going on or
am I completely wrong?

Cheers! -- Jim O.

>
>TT 030 is now available to ordinary customers in Germany. The basic package
>includes:
> - CPU 32 MHz (not 16 Mhz as in the prereliese)

Yawn....Can someone explain to me what this 32mhz figure is all about?
The DRAM is far too slow to take advantage of it and I'm sure that
Atari's custom chips can't keep up as well. Is it just hype?

> - 4 Mb ram (all slow ST-ram)

Expected...

> - 68882 32 MHz is included

Surprise! And a pleasant one at that.

> - Hard disk ST157N-1 46,3 Mb 28 ms

Ho hum....

> - VGA monitor

A little wimpy IMHO. How about some REAL graphics?

> - DEM 7298,-

Reality check: that is US$4900 folks. You could buy a MacII ci
system for that and have FAR better graphics capabilities (not
to mention a HUGE software base).

>FAST-ram can be upgraded to 26 Mb.

How? Using 4 meg SIMMs?

>
>Other options:
> - 110 Mb, 15 ms, 32Kb hard disk cashe (with 8 Mb memory DEM 8798,-)

This is more like it. However, it will cost you an additional
US$1,000. Is it worth it? Probably cheaper to upgrade yourself
I suspect.

> - 21" B/W monitor (1280x969) (with above DEM 11298,-)

A little better, but at US$7550????? That could easily get
you a Mac IIfx system or a SPARCstation SLC or a NeXT 68040 box,

etc...

>While price is higher then anticipated, the shift from 16 to 32 MHz,
>2 to 4 Mb ram and 30 to 46 Mb hardisk is significant.

While it may be "significant" to you that Atari is finally switching
away from a 16mhz 68030, every other manufacturer has done so a
LONG (in computer hardware terms) time ago. Sticking with the
16mhz version would have been a virtual guaranty for failure.
15mb extra of HD space is hardly significant. I suspect, anyone
willing to pay THAT much for a PC will want more.

>Still with 33MHz 386 PC prices coming down the price seems too high.

Agreed. If Atari wants to cultivate the Power Without the Price
buyers, then they will have to live up to that slogan.

>It is about 4 to 10 times faster then ST. A lot of ST programs (the clean
>ones) run as such (Calamus works fast and nice).

Ah, but many of them aren't. There are still a lot of programs that
break on a NORMAL ST when switching to TOS 1.2/1.4!!!

>Next year the Unix version will have A32/D32 full size VME/Eurocard slot.

Forgive me if I'm a little skeptical. I'll beleive it when I see
it.

3526. Grammatic checker for the ST?

Newsgroup: comp.sys.atari.st
Date: 1990-11-25 18:46:24 UTC
From: rriesen@hydra.unm.edu
Message-ID: <1990Nov25.184624.10595@ariel.unm.edu>
Source record: 237043

I am looking for a grammatic checker for the atari ST.
Something like Grammatik IV from Reference Software for the
IBM PC would be great. Is there anything similar available for
the ST?

I am using First Word Plus for my writing and am quite
happy with it, except for the missing thesaurus and grammatic
checker. Any suggestions and comments are welcome. Please reply
by e-mail. Thanks.

3527. STalker 2.06 & STeno 1.03 patches

Newsgroup: comp.sys.atari.st
Date: 1990-11-25 21:04:29 UTC
From: bright@ccu.umanitoba.ca
Message-ID: <1990Nov25.210429.22650@ccu.umanitoba.ca>
Source record: 237048

Uploaded to atari.archive:

[Note: These are *patch programs* only; they're useless if you don't already own previous versions of STalker and STeno.]

STKR_206.LZH:
This ARC contains a patch program which will update versions 2.00 through 2.05 of STalker to 2.06. New features added since 2.03 include: a new remote host mode, where STalker acts like a mini-BBS allowing you to logon to your ST remotely and upload, download, browse directories, and more; a new "Preferences" command which makes the old CONFIG.PRG utility obsolete; improved VT100 emulation, with bold, underline, inverse, and blinking attributes all supported; a type-ahead mode that uses STeno as the type-ahead buffer.

STNO_103.LZH:
This ARC contains a patch program which will update versions 1.00 through 1.02 of STeno to version 1.03. New features since 1.01 include: a new type-ahead mode for use in conjuction with STalker; "Insert File" to insert a file's contents at the cursor position; "Save Selection" to save a selected block of text as a separate disk file.

3528. 2 questions on memory expansion

Newsgroup: comp.sys.atari.st
Date: 1990-11-25 21:32:32 UTC
From: ggreenbe@rodan.acs.syr.edu
Message-ID: <1990Nov25.213232.17161@rodan.acs.syr.edu>
Source record: 237049

Let's take these separately:
1. I've got a 520ST...not the oldest, but rather the one that has the rf modulator in it AND an external power supply. Now, can this machine handle an internal upgrade to 4 Meg? I seem to recall there could be some problem with the power supply not being able to handle all the memory...what is going on here?
2. Does anybody know how to get in touch with Frontier Software from the USA? They are a company in Great Britain that manufactures an external memory expansion module for the ST. I've got a couple of questions about it (e.g. where does it connect, any limitations on how much memory a particular machine can handle, etc), and I thought it would make most sense to ask them directly.
Thanks very much. You can email me directly, or post here.

Does anyone know the (legal) status of the TT control panel. Specifically, is it freely distribuitable or (excuse the pun) a "controlled substance" <groan>
thanks in advance
- Todd

I agree completely. One of my major peeves about copy protected software is that it can't be installed on a hard disk. Your stuck with a physical floppy diskette while you are REALLY paying for the software itself. The honest people are the ones who get penalized.

Unfortunately, I suspect (or more important, software publishers suspect) that more money is lost in releasing unprotected software to "potential pirates" than would be lost by offending those who boycott protected software. When unprotected software starts outselling protected software (don't hold your breath), publishers will take notice and MAYBE they'll stop the copy protection (again, don't hold your breath).

The 32MHz cpu of the TT sits on a little card on top of an otherwise 16MHz machine as far as I know, not even with cache memory on that card. Some mag reported a 40% speed increase over the 16MHz machine.
I'm waiting for what Dave Small will produce with his 030 card for the ST.

Well, the only ST software dealer in town just shut his doors for good.
Doesn't matter...I haven't seen a new title worth getting there in months
now. Is it time to get an IBM PC clone? Or is there hope for some sort
of re-birth of the ST software scenario?

Bummed,

There's a line in the Dialer Setup dialog box called "Retries:".
Set this to 1 or any positive number and that problem will be solved. I
think zero in this line means try until you connect.

Yeah-- My drive wouldn't even read the second disk to ``BLOOD MONEY''
(I use a backup program on it and my drive used the BACKUP DISK fine...
but not the original. Whatever...)

I like the way ``BATTLE CHESS'' was done. You enter the codes at one time.
(Battle Chess is great on a hard drive...)
``THE IMMORTAL'' makes you enter codes every time you go to another level.
(I have yet to see how this can be put on a hard drive...)

Message-ID: <1990Nov26.161641.4147@msuinfo.cl.msu.edu>
Source record: 236903

Can somebody give some answers about Gemini 1.2!

1.) Will it run on TOS1.0 (older versions needed 1.2 or above)?

2.) Will it run on a 520ST (older versions needed more memory)?

3.) Is it available in the U.S. yet (I don't care if it is in
German)?

4.) Anybody wanna sell used TOS chips above Version 1.0. Nobody is
really likely to sell 1.4. So I'd settle for 1.2.

Just a poor undergrad looking to upgrade a little. Will TOS 1.2 allow
programs like monSTer (packed with QSTII) to run correctly. It bombs
under TOS 1.0.

>> - DEM 7298,-

>Reality check: that is US$4900 folks. You could buy a MacII ci
>system for that and have FAR better graphics capabilities (not
>to mention a HUGE software base).

Doing that kind of price comparison is going to get you looking really stupid someday. As a matter of fact you already look stupid about it. Pardon me. Just pipe that to /dev/null :-). However,...

Here's another reality check, this time for you: in Germany, and that's what we were talking about last time we met on the subject and what we're talking about here, Apples are more expensive than Ataris by a lot. Your MacII ci currently (c't, November issue) costs 14480 DM (40MB hard disk, 4MB RAM). They just lowered the price, BTW, from a whacking 18100 DM) (A DM is a Deutsche Mark and the $ exchange rate currently is 1.46 DM/$.)

That is to say, your Mac, by your reasoning, costs $ 9917.81. Now tell me what great machine you could get at THAT price - will you buy a SPARCstation now?

The whole pricing thing for Apple boils down to this (an article which appeared in c't [a computer magazine from Verlag Heinz Heise]):

\fBMac educates at discounts\fR
This is good news: Apple in Munich has extended their support program for the educational sector to the 68030 SE/30 and the LaserWriter SC. Against submitting an enrolement certificate (ger: Immatrikulationsbescheinigung) students (in addition to schools and teachers) buy the SE/30 (2/40) for 5724 DM (list price: 7632 DM) and the LaserWriter SC for 3263 DM. The standard SE (1/40) is still offered for 2900 DM. Wouldn't it be nice to be twenty again...

By way of a 'European pricing alignment' Apple has also lowered the list price for the high end modell Mac IIci: equipped with 4 MByte RAM and a 40MB hard-disk it now costs 14480DM (used to cost 18100 DM), the version 4/80 with fast 80 MB harddisk goes for 15840 DM.

Three new machines have been announced in the US already: for one 2 color Macs with 68020/030 processors named Mac IIs and LC as cheap versions of the modular Macs and the at $1500 US pretty cheap Mac Classic which will replace the Mac Plus and SE machines sooner or later.
-end_of_article--

Well those are nice facts but the prices won't induce anybody on a low budget to go for the Macs.

>>FAST-ram can be upgraded to 26 Mb.

>How? Using 4 meg SIMMs?

Well, 4MB DRAMS in any case. BTW, if i read the TT test in c't correctly, the low end version sports not 4 MB ST RAM but rather 2MB ST- and TT-RAM. The DRAMS reside on 2 PCBs. The first carries 2 or 4 MB ST RAM (the old ST limit still exists) depending on your TT version. At addresses higher than 16MB there's the fabled TT RAM, 2MB by default. Those two MB are on the motherboard. They can be upgraded using another board to up to 16MB it says (that works out to 22 MB max. for me [4MB ST + 2 MB TT motherboard + 14 MB TT additional board] so I must be missing something. Then again maybe not. The test editor also figures out 22 MB at the maximum). The TT RAM has (according to the article) a 32 bit data bus and the CPU shares it with the DMA for the REAL SCSI only. Except for the 16MHz layout that should be reasonably fast.

As you and everybody else around have noticed, the motherboard, RAM and peripherals drivers are all designed for 16MHz system clock. Only CPU and coprocessor are currently tuned to 32 MHz there. God knows when there'll be a full-blown 32Mhz version.

Some more facts from the test: The VME slot didn't exactly make the testers scream with joy. Seems it isn't ready to drive cards drawing lots of current. Also, the holders are solid metal so cards with active elements close to the edges might produce lots of short circuits in there.

To make a long story short: the benchmarks, the programs that run (or don't) the test summary:

a) Quick Index 2.1:

ST TT TT ST+Hyperchache030
processor 68000 68030 68030 68030
clock 8MHz 32 MHz 32 MHz 25 MHz
cache - off on on
TOS 1.4 3.1 3.1 1.4 modified
res. ST high TT med. ST high ST high
remarks - - read TT used 4 caches
RAM

QI figures:
CPU memory 100% 159% 719% 497%
CPU register 100% 204% 827% 642%
CPU divide 100% 768% 1024% 792%
CPU shifts 100% 2050% 3534% 2697%
DMAreadFloppy 100% 160% 160% 159%
GEMDOS files 100% 100% 100% 100%
TOS text 100% 68% 238% 256%
TOS string 100% 87% 219% 245%
TOS scroll 100% 44% 298% 145%
GEM dialog 100% 111% 257% 361%

Moral: Never work without cache. I won't explain Quick Index (cause I don't have it) The figures are taken from c't! They say that the slow TOS screen update figures have to be put into relation to the video RAM, which is now 5 times as big.

b) Programs

VIP 1.4 - no mouse pointer, no reaction to keys
OMIKRON-BASIC 3.0 -
GFA-BASIC 2.0 - gets into the Editor. produces errors on RUN (Bus error)
GFA-BASIC 3.07 - Bus error
c't-View + (GFA Basic Compiler product!)
Messwert (?) - Bus Error
Calamus SL +
Megapaint 2.3 - Alert box: Megapaint only works with module
Leonardo +
Sagrotan 4.14 (Virus checker) - Bus error
Fastcopy III +
Signum 2! - CPU halts
Larry 2 + doesn't even care about screen res.
Tetris +
STAD 1.3+ +
Edison 1.0 +
Skyplot plus 5 +
1ST Terminal 1.03 +
Retouche 1.11 + only in ST high res mode
Supercharger 1.4 + Problems doing graphics (fixed in new vers)
LHarc 5.21 +
HDU 2.2 +
LDW Powercalc +
Word Perfect 4.1 -
1ST Word PLus 3.15 - Text twice as large as usual.

+ Runs - doesn't run on the TT

Short test summary:

positive negative
+ many external interfaces - misconstructed, tight casing

+ equipped pretty good - RAM slows CPU down, 16MHz motherb.
+ keyboard OK - just a 720K floppy disk drive
+ eye-saving monitor - VME bus not up to strain
+ the new TOS

Well, not to bore you any longer - that's it folks. For more details
read the C'T, Nov. 1990. It features a test.

BTW, NEVER compare prices between the westcoast of the US and the middle
of Europe - it just dosn't work.

Martin

>
>Nick

Nick, if you have access to Compuserve or GEnie, you can download it from there or a similar service. I always post the master copies to Compuserve and GEnie and let it spread from there. If you want a second hand copy, you can always take your chances with those good for nothing public domain software distributors that I personally have a strong dislike for. The other source is to get it directly from me. If you have sent in your shareware donation for Xformer in the past then you should be on the mailing list for the Xformer 2.6 update which I will probably do just to clear up a few bugs in 2.5. If you want my opinion (which you'll get anyway) I'd suggest you get a life and stop wasting your time with obsolete 8-bit software in the first place.

Darek @ Branch Always Software

In article <fred.659451769@prisma> fred@prisma.cv.ruu.nl (Fred Appelman) writes:
->->I used BackupST to back up my drive and I'm quite happy with the results.
->->I do have a couple of suggestions for enhancements:
->->
->-> 1) An option to verify the backup would be nice...
-> Can you be more specific on this point. What would you like to have
-> happen during this verify. Do everything you do in a restore, except
-> writing the results to disk?

Exactly - this would confirm that there were no media problems, as well as
add some peace of mind that the indices are intact...

->-> 3) (If not already present) some error-correction data..

-> The error correcting data is minimal...

The error correcting code would ideally allow the backup to be recovered even
if a full sector is bad; of course, this would require some fairly extensive
error correction code, and I'm certainly not the person who can suggest how it
be done! PC Tools and Fastback (for MS-DOS) suggest that you can have up to
eighty sectors bad and still fully recover a backup, so it can be done, but
I don't know what the cost in speed/backup size would be. I suspect there are
some freely-published papers in the academic/Usenet world which describe
algorithms for doing this (similar to compression algorithms - perhaps the
two can be combined).

3542. HacMan II premiers at atari.archive

Newsgroup: comp.sys.atari.st
Date: 1990-11-26 19:24:43 UTC
From: dmb@wam.umd.edu
Message-ID: <1990Nov26.192443.1450@wam.umd.edu>
Source record: 236908

Access to the Internet has its privileges. Now YOU can be the first person on the block to own a copy of HacMan II, the sequel to HacMan, released back in 1987. Atari.archive are the proud sponsers of the first official release version.

To play the game, you'll need a color ST (any vintage) with at least one meg of RAM. The game will run from single-sided floppies if necessary.

HacMan II was developed with some game design tools that will (eventually) be made publicly available (see the docs for more info), so I am very interested in hearing of ANY problems anyone has with the game on ANY hardware/software configuration. Please report any odd behavior you see. Thanks!

Look for atari/games/hacman2.zoo at atari.archive.umich.edu. Be sure to FTP in binary mode and extract paths when unzoo-ing:

```
zoo x// hacman2.zoo
```

Once again, if you don't have at least one meg and a color monitor the game will not run. The readme.doc file contains installation info.

What's New in HacMan II?

Many people complained about the lack of sound in HacMan, so HacMan II has all digitized sound effects. (I hope you all are satisfied.) In addition, HacMan II has these new "features":

- 100 new levels
- Four new ghosts
- Cameo appearances by many other creatures
- Puzzle boards
- Skips (skip a board you hate by pressing the space bar)
- Ghost hit/miss statistics
- Secret warps
- A surprise or two for the really devoted

The entire HacMan II design team (see the credits screen) hopes you'll enjoy the game.

Dave Baggett
dmb%wam.umd.edu@uunet.uu.net

PS> If anyone out there has a TT and could try the game out, please let me know how it goes. Thanks...

3543. Monochrome Atari ST Monitor Needed Desperately!!!!

3550. atari.archive uploads

Newsgroup: comp.sys.atari.st
Date: 1990-11-27 08:22:14 UTC
From: millert@tramp.Colorado.EDU
Message-ID: <30273@boulder.Colorado.EDU>
Source record: 236918

The following files are now in or will appear shortly in the atari/newitems
directory at atari.archive.umich.edu
note that most are re-uploads that were nuked when the archive crashed

artpak.tos :: a collection of utilties to convert between different picture
and graphics file formats.
driveoff.lzh :: turns off the busy light on the floopy drive if you autoboot
from a hard drive.
dterm_1.lzh :: dterm version 1.0 - first version to be released as shareware
now includes an autodialler. Good term. program
fujidesk.lzh :: puts a spinning fuji next to the Desk menu on the menubar
if and only if there is a Desk menu. Check it out.
gimmicks.lzh :: A bunch of gimmick type programs brought back from a German
Atari show.
ke22.lzh :: programmer's editor. Kepco edit v. 2.2 - similar to pedit
parkhd.lzh :: an acc to park your hard drive...
sfx_lzh.lzh :: create self extracting lzh archives. Works well with
lharc 1.13 (lzh11308.lzh on atari.archive)
speak_ez.lzh :: how to incorporate stspeech voice synthesizer into your own
programs. Includes examples in C
st_whiz.lzh :: Great menu program. Best I've seen.
term4.lzh :: Term program from Kerry Flint. Does automatic zmodem and
ymodem-g. Has simple macros and a good dialer
topdown.lzh :: loads auto programs and accs into high memory to eliminate
conflicts with some programs.
unitmacs.lzh :: some macros for uniterm.
xyz2.lzh :: xyz ver. 2.0 xyz-modem upload/download (this one has docs)

For those without ftp access, mail atari@atari.archive.umich.edu
with a single line
help
the mail server will send you a help file.

Dear All,

Does anyone know of a Homoeopathic Repertory and/or Materia Medica
for the ST? I have heard that there is such a thing for the Mac,
but I have no details.

PD or commercial - either would be fine.

Thanks,

Brian

Hello everyone, looks like I LOSE and YOU GAIN,

I have a few 1040STe's, yes thats color, stereo, simm upgradeable for
a going price of:

$575 - 25 dollar loss!

Please help me get rid of these beaste's. I made a major boobo when I got
these in the mail so, once they are gone, they are GONE!

I'll even throw in a box of free disks, ship TO YOU anywhere in the USA
C.O.D....I'll even pay shipping!

I never opened the boxes! THEY ARE NEW as new can get.

I read over one of the nets that there is a MONO emulator for color users that creates a REAL MONO screen, not the 1/2 size ones (i.e. not 320 lines trying to do 640, but actually 640 squeezed on the screen). If this is so, where could I find this file?

Also, is there a file around to convert German text into english? I have a Germna dictionary, but for big DOCs that's a pain. If so, where can it be found? (in the U.S> preferably, or FTP accessible)...

> -- Howard Chu @ University of Michigan

Are you sure that it is in the ST? I'm assuming that the weirdness is being caused by the multi-sync circuitry of the monitor, since this seems never to have shown up on a non-multisync, and I find it very unlikely that the video circuitry in the ST could 'accidentally' send out each scan line _twice_ on the same line...seems that this would require a doubling of the horizontal scan rate since no information is being lost.

What is the rating of the power supply? How many watts (or volts/amps) can it output? That would help a lot. If it's about the same as a Mega's PS rating, you'll have plenty! (since you don't have the internal floppy to power.)

Those prices are heavily-discounted student prices. I'm not sure they would be a fair standard to judge the TT prices against.

3561. Re: Using a Seagate ST225 w/ ATARI 520ST

Newsgroup: comp.sys.atari.st
Date: 1990-11-27 20:29:12 UTC
From: cummins@d.cs.okstate.edu
Message-ID: <1990Nov27.202912.23877@d.cs.okstate.edu>
Source record: 236930

I've used an MFM (IBM segate ST 225 type...) harddrive, and it was
a minor pain. I had to buy

1) Case/Power supply ($110 brand new... can be had for $70 I suppose)
2) Host adapter (ICD's ran $110 brand new...)
3) SCSI MFM HD Controller ($80 or more)
4) Misc cables... ($15-20)
$315
Total cost $300 or more in addition th the mechanism.

By going with an SCSI mechanism you save $10 in cables and $90 in the controller
card...

But if you can find an Ompti SCSI MFM controller or an Adaptec 4000A used...
and Ditto for the other parts... you can save at least 50%...

3562. Atari Drive Problem

Newsgroup: comp.sys.atari.st
Date: 1990-11-27 21:47:37 UTC
From: pokey@uncmed.med.unc.edu
Message-ID: <1746@beguine.UUCP>
Source record: 236931

I just sold a 1040ST through the power of the net, and following shipment, he has experienced trouble with the drive. It apparently gives a "disk unreadable" error. Is this a head alignment problem? I never experienced this failure before I shipped the system. If it is a head alignment problem, who will realign internal Atari DS drives? The buyer lives in Lawrence, KS, is there anyplace near there for Atari service, hello anyone in Kansas? What about service by mail, as a last resort? ANY HELP on this is appreciated, I feel terrible shipping out a system that is AOK and having it arrive as inoperable hardware. Please E-mail me if you have any comments.

pokey@uncmed.med.unc.edu Patrick O'Brien

3563. ST for sale(update)

Newsgroup: comp.sys.atari.st
Date: 1990-11-28 00:55:10 UTC
From: coteb@woods
Message-ID: <1990Nov28.005510.1@woods>
Source record: 236949

Hi all. Here's an updated list of stuff I'm selling but I've lowered the prices. I'd like offers on most of the stuff before I sell so I won't get stuck with stuff I can't use. Thanks.

1040ST CPU(mouse and joystick included) - $375
SC1224 Color Monitor - $135

5 1/4" 360k Disk Drive -There is a loose wire in the case that sometimes causes the drive not to be recognized. This can be fixed since the drive easily comes out of the case. If I move the wire around, it seems to be ok. Asking only $55 for this.

Software: Multidesk, LabelMaster, WordUp 3.0, Wordwriter, Music Studio and quite a bit of PD software, and about 25 assorted ST mags. Asking about $50 or best offer

I also have an Okimate 20 color printer that I never used because it doesn't have the Plug 'N' Print module. It was a display model at Sears so I don't know how good it works. They probably didn't use it that much. I'd like $35 in as is condition or best offer for this. Above prices do not include shipping. We can discuss that part later. Thank you very much.

Brian Cote

3564. Drive alignment/damaged disks? Help!

Newsgroup: comp.sys.atari.st
Date: 1990-11-28 01:18:23 UTC
From: kuento@kuhub.cc.ukans.edu
Message-ID: <27114.2752bbff@kuhub.cc.ukans.edu>
Source record: 236945

I just recently bought a used 1040ST, and within a half hour of unpacking it (it was mailed), it was bombing, freezing, and giving me "unreadable disk" warnings out the wazoo. I have two questions - does this sound like a problem with the drive head going out of alignment (as a result of shipping), and if so, are the "unreadable" and unbootable disks likely to be damaged now as a result of being put in the machine? I ask because at least one of the disks was copy-protected (DungeonMaster), and another was the Disk Doctor! (how ironic...). Too bad Lawrence is so far from the nearest service shop. I doubt there's another Atari ST in the entire town! I don't suppose there's anything I could do myself about a drive problem??

3565. 4160 STe for sale

Newsgroup: comp.sys.atari.st
Date: 1990-11-28 01:34:50 UTC
From: uace0@menudo.uh.edu
Message-ID: <1990Nov28.013450.2680@menudo.uh.edu>
Source record: 236933

For sale by owner:

4160 STe

4 meg STe with SIMs from the factory. Mint condition.
Has stereo sound jacks, analog joystick ports, ds disk drive, all usual ports,
and TOS 1.62

Mail your best offer to us, or call us at the phone number below.

We'll throw in our software too, if you buy it.

```

In this list, games have been rated on a scale of 1 to 10, 10 being the best and 1 being the worst. For each game, the total number of votes, the average rating, and the vote distribution are shown. New games are indicated by a "*" before their entry. If a "(C)" appears after the title it means that the game is a CD-ROM or disc system title. If a "(J)" appears after the title it means that the game is currently only available in Japan.

The general guideline for ratings is:

8-10 worth buying at full price
6-7 worth buying at a discount, or if you're particularly interested in this kind of game
3-5 only worth renting
2 only worth playing for free, and only for a few minutes
1 worthless

The vote distribution uses a single character to represent the percentage of votes for each ranking. The following character codes can appear:

"." no votes cast "3" 30-39% of the votes "7" 70-79% of the votes
"0" 1-9% of the votes "4" 40-49% of the votes "8" 80-89% of the votes
"1" 10-19% of the votes "5" 50-59% of the votes "9" 90-99% of the votes
"2" 20-29% of the votes "6" 60-69% of the votes "*" 100% of the votes

Please consult the article entitled "ABOUT THE VIDEO GAME RATINGS REPORT" in the newsgroup rec.games.video for more details, including information on how to vote.

Questions, comments, problems, and errors should be directed to the list maintainer at either of the below addresses:

3567. Re: 2 questions on memory expansion

Newsgroup: comp.sys.atari.st
Date: 1990-11-28 02:44:57 UTC
From: thaanuj@prism.cs.orst.edu
Message-ID: <1990Nov28.024457.17483@scion.CS.ORST.EDU>
Source record: 236946

I own an old 520 with the same rf mod/power supply configuration. Even if the power supply puts out enough juice for 4 meg, I have heard that there isn't enough room under the rf shield and outer plastic housing for all those ram chips. If anybody has info to contradict me, I want to know 'cause someday I would like to have 4 meg as well.

While we are on the subject of Paleozoic Era hardware, could somebody tell me what I have? I bought my computer used last year. My floppy drives and power supply are external. I have an RF modulator. I met the guy I bought this from back in Sept '87, and he owned it at the time, so I know it is at least 3 years old. I also know it is TOS 1.0. I have had the lid off this sucker several times, but I don't know how many chips my roms are. 2? 6? Which ones are they so I could count them? A few months ago there was a post about "bad" MMU's. What was that part number again? Is mine likely to have it? It probably makes more sense to get a Mega or an STE instead of expanding this machine, but I am too broke to buy a new one and too sentimantal to part with this one. If anybody can answer all/some of these questions, I would appreciate it greatly.

3568. SC-1224 for sale

Newsgroup: comp.sys.atari.st
Date: 1990-11-28 02:50:42 UTC
From: Xorg@cup.portal.com
Message-ID: <36294@cup.portal.com>
Source record: 236934

FOR SALE:

Atari SC-1224 color monitor, used as a backup monitor for over two years ever since I bought a mono monitor. As my game playing time evaporated, the amount of time I spent using this monitor dropped. This is a very early Atari monitor and the display and sharpness is far better than any of the new Atari color monitors I've seen over the years, but I don't believe its a JVC.

$250 and I'll toss in a disk full of PD software and a commercial game or two I no longer play.

Peter Szymonik

3570. Re: Drive alignment/damaged disks? Help!

Newsgroup: comp.sys.atari.st
Date: 1990-11-28 05:23:53 UTC
From: cummins@d.cs.okstate.edu
Message-ID: <1990Nov28.052353.28567@d.cs.okstate.edu>
Source record: 236947

What I did in a similar situation (it was a drive problem) was
seek out prices and compatabilities of 720k drive mechanisms.

I ended up with an Toshiba ND552 for about $65, with the incompatability
of requiring the media change switch to be glued down. No problem, a
3 minute job. The Atari senses disk changes by monitering the write
protect lines, and ignores the media change lines. The ND352 disconnects the
write protect lines when the disk is ejected, therefore there is no
change in their status when you remove a disk. The Atari didn't know
I had changed the disk (until I glued down the switch for the media detect).

$70.00.... No biggie (IMHO)

Good luck!
John Cummins cummins@d.cs.okstate.edu

I wonder what the "heavily-discounted" student prices for the TT boxes
will be.

Or does Atari still not have its s___ together.

Most people still are unaware that Atari makes a 68000 machine.

> Ed Krimen .....
I think Ed's advice is probably sound. If you know what
you're doing inside an ST, go ahead...if you don't, however,
I'd recommend sending it to someone who does. I had a similar
problem with my 520 a while back...at first it gave
"unreadable disk" warnings, but then after a bit it simply
booted without acknowledging the existence of a floppy drive.
I called L&Y Electronics in VA and they said they have an $85
flat fee repair for things like this. When I got it back, I
found that they had replaced the GLU chip, and now everything
is fine.
I have no connection with L&Y other than being a satisfied
customer...I have nothing but praise for their service, and
would recommend their work without hesitation. They mailed
out my machine this time 2 days after they got it.
Good luck,
Gerry

I use Sozobon 1.2 on my 520ST; it's possible with a single-sided drive
and it's even possible to speed things up with a carefully-sized
ramdisk and Gulam. I kept libraries and ld on a second disk, and
would generally only have one swap for compile-assemble-link.

Now I have a double-sided drive, which makes things easier.

The price is right for Sozobon and Gulam, too.

3578. Reading DOS formatted diskettes

Newsgroup: comp.sys.atari.st
Date: 1990-11-28 15:44:33 UTC
From: waynem@oakhill.UUCP
Message-ID: <4252@dora.oakhill.UUCP>
Source record: 236959
Cross-posted to: comp.sys.atari.st,comp.sys.next

The scoop:

Work: access to the world, able to obtain great stuff via the net.

Home: access to work via 2400 baud modem (yuck).

Twist:
I have a NeXT at work with a DIT CubeFloppy 1.4. The little
black box supposedly formats a 720K DOS disk; according to
the documentation.

However, if I format a disk on the DIT and take it home, the
Atari drive reacts as if it were an unformatted disk.

If I format the disk on the Atari (from the GEM desktop), the
DIT reacts as if the disk were unformatted.

If I format the disk using DCFORMAT.PRG and write the MS-DOS
boot sector, the NeXT accepts the disk as formatted.

If I write files on the MS-DOS boot disk from the Atari, the
NeXT does not see them; they do not appear in the directory
listing.

If I write files on the MS-DOS boot disk from the NeXT, the
Atari does not see them; they do not appear in the directory
listing.

Help: What am I doing wrong?
Is the format of the diskettes not compatible?
If so, is there any software to transfer between the formats?
And if so, from where can it be obtained?

Thanks in advance for the help - Wayne

15.7 watts isn't much... I'm no authority on STs, but it sounds like your close to the edge there. Keep a voltmeter handy when you upgrade, and if the voltages drop much when you add the memory (and the machine acts flakey) you need a larger PS. Which should be easy to find... (jameco and a few other paarts houses have odd Power Supplies in abundance! Just cut off the cord that comes with it, and replace it with your cord...)

Source record: 236962

I just had a strange thing happen on my way to boot up my ST:

I have a 1040STfm, SM124 mono mon., sm1224 col. mon., and a megafile 30
HD. When I would boot it up, the desktop was frozen. I couldn't move the
mouse or do anything. I would reboot and the same thing would happen. I would
turn the computer off and the back on, but the same thing kept happening.
I then booted with my Dungeon Master (tm) disk and it booted and got up to
the resume/enter screen but the mouse still wouldn't work (alt arrow keys
neither). But when I rebooted after DM, everything was a-ok.

Has this happened to anyone else?

Source record: 236940

Yay! This game is professional quality at its best! Y'all have outdone yourselves!

I could have easily spent all day playing it on our TT (yes, it works great on our TT - sounds and all), but I've got work to do.

Bravo!

Unfortunately, the docs didn't say what files belonged in what directory, so I had to go digging in the program to find the path names. For all of y'all who try to get it running, here is what I found:

Folder DISK1 contains the following folders:

PICS
FILMS

In DISK1\PICS put the files: disk2, loading, title and opening
in DISK1\FILMS put the file 2.flm

Folder DISK2 contains the following folders:

PICS
FILMS
SAMPLES
FONTS

In DISK2\PICS put the following files: front and board
in DISK2\FILMS put all the .FLM files
in DISK2\SAMPLES put all the files with number extenders in there
In DISK2\FONTS put all the .FNT files

This will get it running. The ZOO archive did not have the directories in it, so I had a wee bit of trouble.

Dave, give us a call so we can shower you with some accolades! :-)

3584. Help Wanted: Chicken & Egg Problem

Newsgroup: comp.sys.atari.st
Date: 1990-11-28 19:22:22 UTC
From: ivan@megatest.UUCP
Message-ID: <14555@megatest.UUCP>
Source record: 236941
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

This is probably a ridiculous question; I have been a SW engineer for over a decade, but never used an ST. My brother has one and has used it primarily to run MIDI equipment. Now he has a lot of hardware he wants to hang on to. He wants to do some 'real computer' stuff on his 1040. So much for the intro.

My understanding (from observing this newsgroup for a while) is that there are "UNIXish" pgms out there -- lots of them. Are you people running UNIX? and if so, where did you get it? McGraw Hill is the only place I've heard of. How much is it? Is is 4.2 or sysIV compatible?

Or, am I way off base -- I dunno (AAARGH!). What we do have is the PD version of uniterm. And a host machine (obviously). Therefore we can get some code from the net, but we don't have 'uudecode', 'compress' and/or other UNIX-type stuff you people must have.

And that's the chicken & egg problem we are trying to resolve. Before any of you get upset at such an uninformed question, there appears to be only 2 stores in the entire Silicon Valley which deal in Atari, and I was unimpressed with their assistance (no offense to their knowledge on marketted software). Once we have the basics, I promise to submit more intelligent articles (if any). Please include any archiver info, so we can get a list of what's out there.

Many thanks in advance!

3585. DeskJet vs DeskWriter: pointer to discussion

Newsgroup: comp.sys.atari.st
Date: 1990-11-28 19:34:10 UTC
From: rrd@hpfcso.HP.COM
Message-ID: <7340040@hpfcso.HP.COM>
Source record: 236942

This is a pointer to the discussion "Re: JetLink Express 1.2 vs HP DeskJet 500", posted in comp.periphs.printers (and comp.sys.mac.misc, if you don't get c.p.p).

JetLink Express is a PCL printer (Desk/LaserJet) driver for the Macintosh. Someone from comp.sys.atari.st or comp.sys.amiga (GET YER HANDS OFF THE KEYBOARD!) emailed me a question about the DeskJet 500 vs. DeskWriter, and I didn't have a good answer for them. Unfortunately, I purged their name etc. last week and I don't remember who it was.

The discussion mentioned above may be interesting to the person who asked me the question. My apologies to the rest of you.

Glad to hear you like it, and (especially) that it has no trouble with the TT.

>Unfortunately, the docs didn't say what files belonged in what directory, so I
>had to go digging in the program to find the path names. For all of y'all who
>try to get it running, here is what I found:

Did you extract it with

zoo x// hacman2.zoo

to get full paths? I was hoping people would do this, but perhaps I
should just upload it as an LZH file so there is no option...Too bad
compressed tars aren't standard on the ST.

To anyone who's had similar problems, please try extracting
full pathnames. The game will NOT LIKE IT AT ALL if it finds files
missing, and NOTE that some files are only loaded when you get to certain
boards. This means that if you don't have all the stuff in the right
places you may get to a board with no shapes, sounds, etc...

If anyone's having trouble, please D/L the new .LZH file at atari.archive
(to appear RSN).

Sorry about the confusion everyone.

3587. Local Atari Users Group - December Meetings

Newsgroup: comp.sys.atari.st
Date: 1990-11-28 21:41:40 UTC
From: daroloso@aftermath.waterloo.edu
Message-ID: <1990Nov28.214140.16258@aftermath.waterloo.edu>
Source record: 236944
Cross-posted to: uw.sys.atari,comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.atari.st.tech

The Kitchener-Waterloo Eight Sixteen Thirty-two (KWEST) Atari user group,
has a separate 8-bit meeting and 16-bit meeting.
We meet monthly, have special interest groups (SIGs), associated bulletin
boards, public domain libraries, and a newsletter "The Hard Copy".

I am on the executive of the group
so I should be able to handle most questions or
get replies from the rest of executive.

The group welcomes new members and visitors with
8-bits, 16-bits, or those just curious.

Meetings held at the University of Waterloo in the
Math & Computer Building.

Rooms open at 7:00 pm. Meetings start at 7:30 pm.

Call 579-3695 for details.

Next Meetings
****
8-bit - Wednesday, Dec 5, 1990
MFCF Lounge, Room 3012 (3rd floor)

16-bit (ST) - Wednesday, Dec 12, 1990
DCS Course Room, Room 2009 (2nd floor)

Hope to see you there,
Dani Roloson

Well, I don't know about NeXT's, but I do know this: I can format
3 1/2" 720K disks on an IBM, and then both the IBM and my 1040 ST can read
and write on the disk. Although, when the ST deletes files from the disk,
it kind of messes up the free-space count, so I always delete from the IBM.

Definitely! Atari shipped a lot of them in the old SH204 "shoebox". It also had inside the case, a "host adapter" (I switched to ICD's), a power supply, and an Adaptec 4000A controller. At least, that's what was included in mine...

My experience with the DIT CubeFloppy is that the software is very buggy.
The hardware is there, the software isn't.

On the other hand, could your drive be a little out of alignment. I
remember reading how 1.44" drive mechanisms are so much more precise than
their 720K counterpart.

3591. STart classics are a rip-off..

Newsgroup: comp.sys.atari.st
Date: 1990-11-29 03:01:25 UTC
From: n8742883@unicorn.cc.wwu.edu
Message-ID: <1990Nov29.030125.28978@unicorn.cc.wwu.edu>
Source record: 236955

For the past few issues, STart has been proudly announcing
their "STart classics" which they issue with the disk based
subscription. The STart classics are nothing more than old programs
which they have already distributed with their subscriptions in past
issues, and are now being re-distributed for "new subscribers" who may
not have purchased them yet.

I find this a load of horse kapooey. A disk subscription
costs around $80 per year. As I have been a faithful STart
subscriber for about four years now, my faithfulness has now been met
by selling me software that I already own-- and last month's "STart
classic" was a program that I never used when I recieved it the fist
time. I feel that STart is ripping me off with this deal, and I plan
to write a letter of complaint to the magazine-- what good that will
do me. I'd be curious to hear if anyone else has similar feelings as
my own.

Time to get off the soapbox here,

Dave posted that to extract it, run zoo with this in the command line:
x// hacman2.zoo

That's a great idea, and it works perfectly -- but not from the ST desktop. It uppercases the arguments, remember?? After bashing _my_ head against the wall for a bit, I remembered this, fired up gulam (thank you Jwahar Bammi!) and typed

zoo x//. hacman2.zoo *.*

to extract it into the current directory.

Great game, Dave! Nice to have a decent game that can be put on the HD. Anyone know how to put Stunt Track Racer, DM I & II, Arkanoid II, GoldRunner II, and a few other of my favourite entertainment software titles on the hard drive?

By the way, what are people's experience with Space Ace? I just got a brand new floppy that seems to work great on everything I have, except of course on my friends Space Ace game. Two of my friends can boot it, but nobody else seems to be able to. What do I do about it?

Thank you all very much for mailing me such a many responses to my request on information about C-compilers.

Most of you recommended using Sozobon-C with a few hundred kB ramdisk. Another favourite seemed to be Mark Johnson C (MJC). Someone did also mention commercial compilers Alcyon C and Turbo C.

I have now downloaded both Sozobon-C and MJC, but haven't have time to do any comparisons between them.

Once again - Many Thanks for You All!

Message-ID: <RALPH.90Nov29144543@orion.laas.fr>
Source record: 236960
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I know that this subject has been discussed before in one of these two newsgroups, but I still can't get OPUS to allow me to make charts. I have saved the messages concerning OPUS installation, all to no avail!

I have run ASSIGNER.PRG which built me the ASSIGN.SYS file at the end of this posting. I then used FONTWID.PRG (or some such name). I reboot and OPUS complains about incompatible printer fonts.

I have tried with either my *very* old GDOS.PRG or with AMCGDOS.PRG. This concerns a monochrome system. I have an Epson FX-80 with only a few printer fonts. Is that the problem?

Here's my beautiful ASSIGN.SYS file that was produced by ASSIGNER.PRG:

```
PATH = C:\FONTS\ ;

Omissions:
See also:

Acquiring the package:

Download the .uue format files, and decode them with the uudecode and arc or zoo utilities which can be found in directory micros/atari/p99

Description:

MKRSC is a simple GEM resource construction program (RCP) suitable for the creation of dialog boxes and menus. The purpose in writing this program was to provide a utility for those interested in GEM programming on the Atari ST/MEGA computers, but not having access to a commercial resource builder. The program is only useful for the creation of new resource files and their associated C header files. The program should work in either monochrome or colour. Documentation and sources in C are included.

3598. A very strange Neodesk 2.05 'quirk'.

Newsgroup: comp.sys.atari.st
Date: 1990-11-29 16:35:53 UTC
From: lhf@ukc.ac.uk
Message-ID: <3330@gos.ukc.ac.uk>
Source record: 236966

I have been using Neodesk for some time now (v2.05), and wouldn't even consider going back to the standard desk. However, I have had a rather worrying 'bug', or rather experience (maybe nothing to do with Neodesk itself).

Basically, when I booted up (and startgem Neodesk), any attempt at launching a program resulted in it being listed. Firstly I took out all my auto folder programs (namely; Superboot, Turbo ST, Hisoft file selector, Shellfix...I think that was all). Then I took out my desk accessories, which were at the time, Neoqueue & Neocontrol. Alas, whenever I tried to launch, Neodesk listed. (it goes without saying that I tried cold booting...a number of times!)

Next, I suddenly remembered that I had a backup of the Neodesk folder on my clean (boot) disk. So I deleted the Neodesk folder on the hard disk, and replaced it with my backup. Still no joy, Neodesk still listed programs. I should mention at this point, that the normal desktop was working quite happily.

In desperation, I also tried pressing escape on bootup, thus cancelling the ICD buffers. Still, Neodesk refused to work. So, I had thought I'd eliminated all these things from being wrong, and replaced them, assuming this was all something very strange indeed.

Ridiculously, Neodesk once again works. I hadn't actually done anything, the system was as it was when the problem started. Suffice to say, I am still very worried, because I don't know what caused the problem.

Was it Neodesk? Was it Superboot (5.something, which I no longer use, just in case)? What was it? Has anyone else out there experienced a similar problem? And if so, did you figure out what caused it, and hence the solution?

(In case it is somehow relevent, here is my setup:
Mega 1 - hi-rez - DS floppy
Third Coast ICD 48Mb hard disk - hence utilities
Hypercache (not on at the time)
TOS 1.2 - Neodesk 2.05
errmmm... I suppose that's all of vaque relevence)

Lee.

3601. Reading DOS formatted diskettes

Newsgroup: comp.sys.atari.st
Date: 1990-11-29 18:03:56 UTC
From: waynem@oakhill.UUCP
Message-ID: <4263@dora.oakhill.UUCP>
Source record: 236970
Cross-posted to: comp.sys.atari.st,comp.sys.next

The scoop:

Work: access to the world, able to obtain great stuff via the net.

Home: access to work via 2400 baud modem (yuck).

Twist:
I have a NeXT at work with a DIT CubeFloppy 1.4. The little
black box supposedly formats a 720K DOS disk; according to
the documentation.

However, if I format a disk on the DIT and take it home, the
Atari drive reacts as if it were an unformatted disk.

If I format the disk on the Atari (from the GEM desktop), the
DIT reacts as if the disk were unformatted.

If I format the disk using DCFORMAT.PRG and write the MS-DOS
boot sector, the NeXT accepts the disk as formatted.

If I write files on the MS-DOS boot disk from the Atari, the
NeXT does not see them; they do not appear in the directory
listing.

If I write files on the MS-DOS boot disk from the NeXT, the
Atari does not see them; they do not appear in the directory
listing.

Help: What am I doing wrong?
Is the format of the diskettes not compatible?
If so, is there any software to transfer between the formats?
And if so, from where can it be obtained?

Thanks in advance for the help - Wayne

From: mg20+@andrew.cmu.edu
Message-ID: <obJIrRW00WAx8B1IRW@andrew.cmu.edu>
Source record: 236971

The ST is dying. If you want virtually anything for it, you'll have to mail order it. Living in a big city does help, however. J&R Music World in New York (I live in NJ, when I'm not in college in Pittsburgh) is one of the few major stores I've seen that still support the ST... although even their support is dying, the software section is 1/3 the size it was 3 years ago and the hardware section has all but disappeared.

Get a Mac, not an IBM. IBMs are for corporate fascists, and besides, Macs are better (ease of use, etc.) Apple isn't about to fade into the woodwork like Atari periodically does. If you can't afford a Mac (get at least a IIsi, not a Classic (yuk, same slow processor as an ST, and 9" mono "graphics")) then get a Spectre GCR (wait for Version 3.0.)

I dunno, Atari's new models aren't too impressive to me, price/performance wise... they may buy the farm for good this time.

I'm getting a Mac IIsi if my parents can/will help me afford it (although it's pretty cheap here with student discounts, $3000 is still a lot of money) or a Spectre GCR if that's all I can afford.

There is a new archive now in place at atari.archive.umich.edu for atari portfolio files. For those of you unaware what the portfolio is, it is atari's 1 pounder 'Palm top' that runs dos 2.0 with limited bios.

I have recently started a mailing list at swood@vela.acs.oakland.edu for atari portfolio users, and there was a demand for an ftp site, so here it is. You can find the portfolio directory via anonymous ftp to atari.archive.umich.edu (terminator.cc.umich.edu) in the atari directory. Seeing as how these files are ms-dos, and not atari format, there is also a symbolic link for the portfolio that can be found in the msdos directory.

Please send files, and please include an explanation of the source, use and and other helpful information with each of the files. Thanks and happy programming.

3604. Serial mouse for ST

Newsgroup: comp.sys.atari.st
Date: 1990-11-29 19:16:28 UTC
From: dalessio@motcid.UUCP
Message-ID: <5299@feldspar23.UUCP>
Source record: 236973

I asked this question before but did not receive any
replies, so I am asking again.

How can I connect a Microsoft compatible SERIAL mouse
to my ST?

There has been a lot of talk about MS mouses, but they
seemed to be about the bus mouse. I have a MS compatible
serial mouse and would like to use this one. I don't
mind cutting the cable if I have to.

Thanks in advance for any help!

3605. The punchline (was Drive align/damaged disks?)

Newsgroup: comp.sys.atari.st
Date: 1990-11-29 19:46:55 UTC
From: kuento@kuhub.cc.ukans.edu
Message-ID: <27150.2755114f@kuhub.cc.ukans.edu>
Source record: 236974

Many thanks to those of you who have sent advice on my drive problem. I put the advice to work and found that:
(a) I was able to format a new floppy just fine, and the machine booted and ran flawlessly with that disk -ergo, it looks like the drive *is* out of alignment.
(b) when I gave the machine a gentle drop to reseat loose chips (as suggested by Doug Monk), most of the "bombing" problems went away, though a few of the disks still do cause an "infinite loop" while attempting to boot with them (falls just short of opening the desktop - can catch a glimmer of the bee, then it makes a grinding noise and tries again, until I switch ot off). Thus, it looks like I probably have some loose chips as well.
As long as I'm getting it serviced for the drive, then, I'll let someone *else* worry about the chips. Thanks again to everyone who helped out! Ain't the Net just great?

3606. MSDOS Emulation and related stuff

Newsgroup: comp.sys.atari.st
Date: 1990-11-29 20:20:43 UTC
From: ggreenbe@rodan.acs.syr.edu
Message-ID: <1990Nov29.202043.13759@rodan.acs.syr.edu>
Source record: 236975

OK...sorry about this, but now I'm really confused. I know that there are at least a couple of other interested parties out there, so I'll go through all this again.

About a month ago or so I decided to really try to find out what was out there in the world of msdos emulation that would provide for EGA or VGA emulation (yeah, I know...I'll need to get a multisynch...but that isn't the question). Well, at that time, ATSpeed had just come out...so at least there was 286 emulation. Also, people at Talon said that VGA emulation was in the works, but didn't mention anything about 286 capability. Well, I called a mail order place that was selling ATSpeed. They said it would do EGA emulation. Then I called Michtron, who was at that time the US distributor for ATSpeed, and they said "no way, ATSpeed doesn't do EGA". So, I had pretty much given up. Well, recently I started to read about a 286 card for SuperCharger and that the VGA card might be ready soon too. Well, I called up Talon Tech today and asked what was up. They said they hope their 286 card would be ready by Jan 1991 and that they hope to have the VGA card ready sometime in the beginning of 1991...OK, I'll buy that. Then they told me that they are now distributing ATSpeed AND that it does EGA!!! What gives?

Well, I am not necessarily going to run right out and buy a machine today, so I can wait a bit...although I would like to be able to pick up a good buy if the occassion presents itself...the point is: I keep going back and forth between the idea of buying a cheap used clone (or putting one together) or getting one of these emulators (if they can give me 286 AND at least EGA [better yet VGA]). While I have a feeling that a clone would provide more compatability, it would be nice to not have another machine taking up a lot of space. Also, in the case of Super Charger, you get to use additional memory, too. Does anybody out there know about ATSpeed, how msdos compatible is it, does it really emulate EGA? (Does it do windows?) If so, please post to the net...as I said before, I think there are a couple of other interested parties out there.

Thanks,
Gerry

3607. Reading DOS formatted diskettes

Newsgroup: comp.sys.atari.st
Date: 1990-11-29 20:59:37 UTC
From: waynem@oakhill.UUCP
Message-ID: <4267@oakhill.UUCP>
Source record: 236976
Cross-posted to: comp.sys.atari.st,comp.sys.next

I need help transferring files from a NeXT CubeFloppy to a MegaST-2

The scoop:

Work: access to the world, able to obtain great stuff via the net.

Home: access to work via 2400 baud modem (yuck).

Twist:
I have a NeXT at work with a DIT CubeFloppy 1.4. The little
black box supposedly formats a 720K DOS disk; according to
the documentation.

If I format the disk using DCFORMAT.PRG and write the MS-DOS
boot sector, the NeXT accepts the disk as formatted.

If I write files on the MS-DOS boot disk from the Atari, the
NeXT does not see them; they do not appear in the directory
listing.

If I write files on the MS-DOS boot disk from the NeXT, the
Atari does not see them; they do not appear in the directory
listing.

Help: What am I doing wrong?
Is the format of the diskettes not compatible?
If so, is there any software to transfer between the formats?
And if so, from where can it be obtained?

Thanks in advance for the help - Wayne

<stuff deleted>

Unfortunately I have to agree--CalCom, the biggest Atari dealer here
in the DC area, has closed and gone to mail-order. There are now 3
Atari dealers in the area, and one of those is mostly emulation stuff.
I blame Atari management, but I won't go on with all that.

But, if you have an educational discount, check out the NeXTStation-
it is the natural step from an ST.

I don't understand this. Do people actually waste time looking for places that *don't* support the ST as opposed to places that do? Why waste your time with J&R Music World? Yes, I know what it's like not to have a local dealer for 9 months out of the year. Pick a dealer that is as local as possible, that gives a reasonable amount of support, and that looks like he's going to be around for a while and help and support him. Bitching about J&R isn't going to do anything 'cause they have other things on their minds besides the ST; they have other merchandise to support them and the ST isn't their main concern.

(WARNING. Tearful success story follows. ;^)

I bought an Omniswitch in San Francisco before I returned to school (3 hours away) only to find out that it may be damaged. I called the dealer and told him about it. He's sending me another one. When I receive it, I will send the bad one back. Find a dealer that does stuff like this and support him. Buy stuff from him. If you like his service, tell other ST users about it.

David Koski

3616. dungeon master editor

Newsgroup: comp.sys.atari.st
Date: 1990-11-29 23:07:48 UTC
From: dkoski@hercules.as.arizona.edu
Message-ID: <570@organpipe.UUCP>
Source record: 236985

Is anyone out there interested in a dungeon master character editor? I wrote one one day over the summer and tried to sell it to EABCO. I talked with EAB himself once, but I haven't been able to reach anyone there since! Well, I was wondering if anyone wanted this kind of stuff... it is an editor that will change your characters while playing the game (you can set characteristics to anything, increase health and mana, even set exp levels), but the most usefule thing it does is heal you! Anytime you are near dead, you can heal back up to full mana, health, stamina. It works on DM and CSB.

If anyone is interested, please mail me with suggestions, questions, comments. I will either release it as shareware, PD, or sell it to START magazine based on response...

Thanks in advance

David Koski

As I mentioned in my follow-up to Mike Vederman's post, I plan to post an .LZH file to atari.archive in the hopes that there won't be so many problems with full pathname extraction. Note that the .LZH will also have an additional doc file that mentions a few things I, ah, forgot to put in the readme file -- like the fact that you press ESC to exit the program -- along with a few hints.

Hopefully the ZOO version hasn't gotten too far around the world yet. If anyone sees the ZOO version posted somewhere, please delete it and replace it with the LZH version so there won't be a million "broken" copies lying around. I'd hate for people to D/L 330K only to have trouble getting the game installed...

Several people have asked for the numeric address of atari.archive. Well, nslookup here reports [141.211.164.8].

BTW, does anyone have a reasonably fast implementation of Lharc? Or for that matter, anything that takes less than _5 hours_ to create an LZH file? The version of LHarc I have makes arc look fast.

In any case, the new .LZH should show up at atari.archive by Monday, December 3.

Thanks,

Dave Baggett

Or just as good, does anyone know where else
to get the documentation for it?

Try funic.funet.fi or jyu.fi if you can't find it enywhere else. It should be in atari.archive, but I'm not sure.

Kippis,

I am certainly thinking of getting a NeXT.

It wouldn't make much sense to spend an equivalent amount
of money on a system that doesn't have an operating system...
or a useful one, i should say.

What's a computer without an OS? It's not much different than
a car without an engine.

There are several software packages on other platforms that i was
hoping would get ported to the ST. Virtually every developer
of these particular packages that i have spoken with tells me they
don't want to have to "deal with TOS"...

> --> Where can I find a drive mechanism? For how much? Can I use the
> controller board inside my SF354 (SS) with it?
> Paul

Last year on ST base of FIDO Net I read several postings about doing this... so I went out, plunked down the $55 on a 720k DS NEC 1037A drive just as told by several sources. I opened up my SF354, unhooked the drive cable and the power cable, hooked them up to the NEC drive (lot of fun since the connectors for the NEC drive and the SF354 mechanism where upside down as opposed to each other), booted up the system and had my self a much quieter, and slightly slower 360K SS drive....

I wrote frantically back on FIDO and was told, "Oh, you must have a newer drive that has the drive side select cut.... better reconnect it, or get an older drive." I tried to reconnect it by following the mechanism's documentation and the SF354, but no luck. I found an older drive and picked it up for $15 (an SF354) and tried it and it didn't work... so if anyone else out there has any input, both Paul and I would be interested!! :)

3627. ST Transputer

Newsgroup: comp.sys.atari.st
Date: 1990-11-30 12:00:37 UTC
From: csual@warwick.ac.uk
Message-ID: <1990Nov30.120037.24132@warwick.ac.uk>
Source record: 236997

I recently posted an article regarding a proposed transputer add-on for the ST, and asked if anyone wanted further details. Enough people have replied for me to post the rest, so here it is.
Before I start though, I want to stress that this add-on DOES NOT yet exist, and may never do, it could just be vapourware but I'm going to pass it on anyway as it sounds pretty interesting. All this info comes from the Dec.1990 issue of ST Format.

Atari are supposedly working on an ST-based transputer workstation "at a price observers believe is simply astonishing". Full tech.spec. is a long way off, but it is likely to attach by the DMA socket and enable the ST to run at 15-20 MIPS, compared to the ST's 1 MIPS.
The price is supposed to be about 300-400 pounds, making it an incredibly attractive sounding graphics workstation.
It is NOT just a rehashed ATW, it is a completely separate project.
Andy Leaning of Silica (major U.K. ST dealers) is quoted as saying that the unit is "bobbing around on the horizon", but "nothing official".

That's about the face of it - if you want to read it with a pinch of salt, that's probably a good idea, but it does sound VERY interesting. And they are talking about a summer 1991 release...

> properly through the parallel port?
> -pete

Hi Pete,

There's a "dummy-up" switch on the back of the Centronics ThinkJet that turns it into an Epson-compatible. It's one of the 8 DIP switches, number 4 or 5 if my memory serves me.

The ThinkJet has two operating modes: PCL (or "HP mode") in the book, and Epson (or "Alternate mode") in the book. The Epson mode works fine, except that the dot spacing is 128dpi. Graphics works fine; it's just 25% (33%?) smaller than you would expect.

Now, whether it works with MacPrint is another story!

That's great. But this is comp.sys.atari.st.

There's already an Amiga/NeXT flamewar going on. If this keeps up we'll also have an ST/NeXT flamewar going on. Nobody learns anything from a flamewar.

So, to stop this in its tracks: If anyone sees a message about NeXTs that they think ought to go on comp.sys.next instead of comp.sys.atari.st, please join me in dropping the poster a polite email message.

3634. GFA Basic Version 3.5

Message-ID: <90334.105515MV010320@NDSUVM1.BITNET>
Source record: 236854

I am considerring purchasing GFA Basic version 3.5. I would like to know however what I am in for, not having tested this program yet. What are the limitations and what are some advantages. I know that the ST basic that comes with the 520ST on the language disk can only have 32k of dimmed variables. And your output is always put in this annoying output window. Are these problems taken care of in GFA Basic?

Thanks,
Thomas

Date: 1990-11-30 17:04:08 UTC
From: depeche@quiche.cs.mcgill.ca
Message-ID: <84@bart.cs.mcgill.ca>
Source record: 236855

I don't know what all this fuss about 'broken' versions of hacman II
is all about. I did a zoo x hacman2.zoo and got everything in the same
directory. Tried to run it, realized that there were subdirectories
involved, and deleted each file, and did a zoo x.// (or whatever it is) and
it extracted with subdirectories.

In the future, I'll first do a zoo v <filename> to see if there are full
pathnames in the archive, and then do the extraction.

jeez... Now if only zoo recognized uppercase letters as commands then
I'd be in eternal bliss (I'm one of those weirdos who can't seem to find a
CLI which I like better than PCOMMAND, even though it has all those stupid
problems such as converting all input lines to upper case).

3637. Hard Drive HELP!!!

Newsgroup: comp.sys.atari.st
Date: 1990-11-30 17:32:50 UTC
From: psurge@ccwf.cc.utexas.edu
Message-ID: <40437@ut-emx.uucp>
Source record: 236857

I am in desparate need of help!!! Last night I was working on my system and I had my hard drive running. All night I was booting off of the hard drive as I tested some modifications I was making to my ST. I had bumped the hard drive but never had it crash. As I put everything away for the night, I parked the HD and turned everything off, then rescrewed the HD case back on, (I had the screws from the back of the case off of it, and it rattles so I was putting the screws back in. Anyway, I barely even moved the hard drive and when I tried to reboot, the Hard drive is seen as unformatted.

I would imagine that the boot sector got messed up somehow. Is there some way to resotre the boot sector and restore the Hard drive itself? I do have backups, but they are from last month, and I have done mucho stuff since then.

It has been mentioned to me that there is a backup boot sector on the disk similar to the way the FATS are backed up. I have the Meg-A-Minute backup program which will restore the boot partition, but I don't have any of the first disks where the boot partition is stored. Is there a program that will allow you to manually enter the boot sector and at least get all the new stuff from the hard disk?

Thanks in advance...(Oh, are there any IBM utilities like Nortons that will do this? I can run them under PC Ditto if that is the case...)

This isn't intended as a flame, but I'd swear I heard of a rumorware
ST transputer hang-on as long ago as 1987. I'm sure it can be done,
and perhaps someone in an Atari lab's even built them by the dozen,
but I take entire BLOCKS of salt when anyone suggests something from
Atari is "on the horizon". (The "event horizon" of a black hole,
perhaps... :) The TT has been "on the horizon" since '87, at least.

3645. USA TT Prices: Finally Here!

Newsgroup: comp.sys.atari.st
Date: 1990-11-30 22:23:42 UTC
From: mjv@brownvm.brown.edu
Message-ID: <58127@brunix.UUCP>
Source record: 236865

[note: I posted this to world since Atari users seem interested in
what things cost in other countries.]

I just got this information from my local Atari dealer (gosh, I
actually have 2 of them!) from his new price list.

Atari TT (32MHz 68030,...we know the specs)
(These are Suggested Retail Price)
2megsRam/50megHD --- $2999.95
4megsRam/50megHD --- $3499.95
8megsRam/80megHD --- $4299.95

TT color monitor -- $549.95
(forgot to ask about the 2-page monitor)

Yes, the TT does include a 68882 (not 881) FPU !! Yeah!
Keyboard is included

My dealer said he could lower the price quite a bit and still
make a good profit. Expect street prices to be about 3/4 of MSRP.

For some comparison here are some Mac prices here at Brown (education
pricing)

MacIIsi (20MHz 68030, one slot,no fpu)
2/40HD --- $2,426.46
5/80HD --- $2,941.50

MacIIci (25MHz 68030, 3 slots, 68882)
1/nohd --- $3,776.22
4/80HD --- $4,232,43

Mac keyboard -- $152.07 (the one similar to the TT's)
Apple 13" RGB color monitor --- $664.89
(yes, there is another color monitor but this one is similar to
the TT's)

Of course, no word on release data. No prices on MegaSTe's.
Hope you find this interesting!

>Is any one else that currently has an ST thinking about a next? I am and
>I hope others are too.

Here, here! I've been looking at getting a new computer next fall, and
my #1 choice would definately be a NeXTstation! Nowadays, as a Computer
Engineering junior, I see that more and more I _NEED_ a powerful Unix
machine, and the NeXTstation is simply PERFECT. I have the same feelings for
the new NeXT machines as I did back when I had an Atari 800 and I first
heard the name 'ST'. I definately want to buy one before I graduate though,
because of the _HUGE_ student discounts available...

Don't get me wrong: I absolutely love my Mega... but I just hope that by

Are you talking about a NeXTstation or about an old NeXT cube? Comparing the NeXT cube vs the NeXTstation is like comparing Apple's Lisa vs the first Macintosh... one was very 'experimental', and the other is more 'streamlined'. And both sets were done by Steve Jobs (he's definately got a talent for going back to get things right!).

BTW, it's very different using a Unix computer that is overtasked with lots of other people using it and using one all by yourself...

3650. Talking about other computers here

Newsgroup: comp.sys.atari.st
Date: 1990-12-01 01:12:19 UTC
From: mg20+@andrew.cmu.edu
Message-ID: <obJkBny00Uh7E4o1Qt@andrew.cmu.edu>
Source record: 236870

Hey wait a minute! Here we go again with someone trying to tell other net posters what they can and cannot discuss on an open bboard... I mean, come on, lighten up.

There *ARE* some things that have no business being mentioned on this bboard, but other computers (vis-a-vis Ataris) should be a "sanctioned" topic. After all, comparisons between computer systems are quite relevant. A feature that proves to be highly successful on one may very well show up on others.

For my $0.02, here's my opinions on a few non-Atari systems:

Amigas: cool, but pricey, and they could "disappear" like Ataris these days...
Macs: cool, although still pricey even after reductions. However, I *KNOW* Apple will be around for quite a while... I want my customer support!
NExts: veddy veddy cool, veddy pricey, and totally nonstandard. An experiment.
IBMs: clunky and not very user-friendly. However, they *ARE* expandable.
Timex-Sinclair 1000s: make good doorstops
...etc. *AND THESE ARE RELEVANT, FOLKS* (Well, sorta.)

If Atari *FINALLY* comes out with the TT (I have yet to see one for sale), and it costs <$2000 (actually, I'd like even less, but...) and if it's accepted, and if Atari gets its marketing/support act together, then all I will talk about is Ataris. Their recent marketing waffles leave me wanting, however.

Message-ID: <17809@netcom.UUCP>
Source record: 236871

True, support for the ST seems to be weakening. I've often thought about buying another comptuter. But after I think it through, I never do.

Recently, Bill Gates, in defending the PC versus NeXT and Mac, said "What is there that you can do on those machines that can't be done on the PC." I think the same (almost) applies to the ST. I can't think of anything that can be done on the PC, or Mac that you can't do on the ST.

In my case, my major uses of my ST are 1) terminal emulation, 2) word processing, 3) hobbyist programming, mostly in C and Pascal. I have yet to be convinced that a Mac or PC can do these so much better than the ST as to make it worth the hassle and expense of selling my ST, and buying, installing, and learning new software. Nor have I seen any thing new that the PC or Mac can do that would make it worthwhile.

If I were buying a new computer, it probably would not be an ST. But since I own one now, I think my time and effort are best spent supporting and enhancing it, rather than buy something new.

3652. New at atari.archive ===>Stitchmeister Demo

Newsgroup: comp.sys.atari.st
Date: 1990-12-01 01:26:18 UTC
From: billm@CSUFresno.EDU
Message-ID: <1990Dec1.012618.14418@CSUFresno.EDU>
Source record: 236872
Cross-posted to: comp.sys.atari.st,misc.forsale.computers

I have just sent Stitchmeister Demo to atari.archive.
Stitchmeister is color program for creating patterns for
counted-crosstitch out of 16 color neochrome images. This allows the
happy stichmeister user to digitize photos of things like family members
roses, etc. in color or 16 grey levels (which tends to work best), and
then print them out as a pattern for counted cross-stitch. (those
little stitched homesweet home, etc. signs that look so homey)
This allows for interesting photorealistic decorations.
Stitchmeister demo has a few shortfalls, such as no error traps, and I
think a couple of other bugs. Stitchmeister Demo may be distributed
freely, so long as it is not put to commercial use.

Be seeing you...

3653. Atari ST CD-ROM - what format is this beast? Is there a standard?

Newsgroup: comp.sys.atari.st
Date: 1990-12-01 03:07:38 UTC
From: phoenix@ms.uky.edu
Message-ID: <16466@s.ms.uky.edu>
Source record: 236873

[]
Hi. I've got a friend who has a CD-ROM disk that he knows was
used in a CD-ROM player attached to an Atari 1040ST. My question:
is there a standard format for such things? He doesn't have an Atari
but has an interest in reading this CD-ROM disk and others of the same
series. He would like to get an Intel box reading it, as he can get
the type of CD-ROM player used on PCs for very cheaply.
We can't ask a dealer, as there isn't one left in the state. (The
last one went bankrupt about six months ago; local Atari ST owners
tell me that they now must drive to Columbus, which is about four
hours away.) So if someone who knows about this could mail me information,
on Atari ST CD-ROM disk format, I'd really appreciate it.
Thanks a lot in advance. Oh, note: I've set the Followup-To tag
to post directly to my mailbox.

3655. Mail Order Problems -- Waiting for my 1040e

Newsgroup: comp.sys.atari.st
Date: 1990-12-01 03:58:32 UTC
From: umochock@ccu.umanitoba.ca
Message-ID: <1990Dec1.035832.24062@ccu.umanitoba.ca>
Source record: 236875

Greetings,

I ordered a 1040e from MicroTyme (Kettering, Ohio). That was back on Sept. 26th. I call them about once a week to get updates on the status of my order (it's their money -- it's an 800 number).

According to them, they have been waiting all this time for a shipment of 1040e's from Atari. Everytime I call they give me a date when they should arrive and everytime I call back on that date they say Atari has delayed the shipping date again.

This is starting (as if it isn't already) to turn into an absolutely ridiculous situation!! Is Atari actually this negligent when it comes to supplying their dealers with products? Maybe this explains why sales for 1040e's are so poor -- nobody can get them from Atari.

Or, is there something I don't know about the mail order company (MicroTyme) that I should know.....

Anybody out there having any similar problems with Atari? I would appreciate any comments on this. Maybe one of those Atari guys who read this board could explain their distribution problems.

Heh - what he's *definitely* got a talent for is getting things *wrong*, the first N tries...

> BTW, it's very different using a Unix computer that is overtasked with
>lots of other people using it and using one all by yourself...

Yes, but none of this is relevant to a discussion about a computer that is overtasked just with its own windowing system...

It would be kind of nice if these folks would use Better Software as the solution to their performance problems, instead of always relying on Faster Hardware. (Obviously the ideal situation is to have optimal software running on the fastest hardware, but you ain't gonna get that from NeXT...)

>
etc.

You rang? Maybe it's because the Mega E is so nearly the machine I thought Atari should have introduced as a cash cow about 10 months ago, to me it looks good. An ST (well, an STE, but who's paying attention to that) running at 16 MHz all the way through on a 68000. Low risk engineering with performance that matches (or slightly beats) the 16-20 MHz 386SX clones that are now 'utility' PCs. It'll be nice if someone puts something useful on VME boards at a hobbyist price, but I can live without it. The new GDOS could be a big improvement if it sees the light of day; seems I've read the same thing about imaging models for PCs and MACs in the last year (True Type, anyone?). The Atari Advantage program, which looked like a neat way to make bitter enemies (start people out on low-end non-upgradable machines while your main product line is a lot better than that) seems to have died.

Meanwhile, Atari still has a better manufacturer repair program than IBM or Apple (what, you want me to compare them with Dell?), and they're trying to help developers where they can.

Seems to me that a year ago there were no STs to be had in the US, and there was a great deal of doubt that TOS could handle large amounts of hard disk. Stacy was a nasty joke. The TT wasn't even a well-defined rumor. The STE wasn't even a rumor. So how's Atari doing compared to that?

What is catastrophic is the situation of Atari dealers. There's no prospect that the people who went out of business getting tortured a little more every week are ever going to be made whole. But that isn't the whole story of Atari STs. The stuff above is part of the story too.

Steve J.

3660. Uniterm Auto-dial loop advise

Newsgroup: comp.sys.atari.st
Date: 1990-12-01 09:22:15 UTC
From: pv@polari.UUCP
Message-ID: <2819@polari.UUCP>
Source record: 236880

This is the explanation of the Uniterm auto-dial loop problem and suggestions
as to what to do.

The real problem here is a small bug in the auto-dialer menu, specificly the
redial number entry. Do not enter "0" as the re-dial number. Any other number
is fine. Repeated Cntrl-c commands will eventually get you out of the re-dial
loop, but in the event of using the forbidden 0, you might have to just hold it
down until you get out. If you enter a lot of redial times and want to get out,
you have to press or hold Cntrl-c for the number of times you asked it to dial.
In 2.0e, Fail1 and Fail2 are not implemented, but are placed there for future
development. All the other entries work and may cause problems if you leave
them blank.
These are the entries I use:
Prefix:ATDT Suffix:Cr (actually you press Cntrl-m here)
Hangup:+++%w(20)ATH0Cr (again Cr means enter Cntrl-m here)
Retries:1 (or whatever, never 0)
Connect Message:CONNECT Timeout:40
Fail1: Fail2:

Note: when you press the Cntrl-m while the cursor is on the menu entry, you willget a small
"Cr" which stands for the Atari ST Carriage Return and means you've
entered a control character. Whenever Uniterm sees this, it will put a carriage return at
the end of the line and execute it.

> my own.

I've been a long time STart subscriber, as well, and I think the STart Classic programs are kind of bogus too. I'd wager a fair percentage of those 'new' subscribers from ST-Log already had STart subs. and the new subscribers from Analog don't care what's on the disk, cuz they're 8-bitters!

But, on the plus side, they're moving to double sided format next issue. This will effectively double the amount of software they're able to include with each issue. So that'll be an improvement in the amount stuff they'll be putting on each issue.

Both of my once exclusive ATARI dealers are now selling
Amigas and clones...

"we have been forced to..." as they say.
Both dealers complain heavily about ATARI as a company...
doesn't make the consumer too excited about buying into it.

Also, they say they are having a hard time justifying why
people should buy an ATARI over a mac, or a clone given the
prices these days.

I always remind myself, with all my "gripin' " , that my ST
can still do what it always has done. TEMPUS is still great.

3667. PCditto problem

Newsgroup: comp.sys.atari.st
Date: 1990-12-01 20:34:53 UTC
From: marshall@batserver.cs.uq.oz.au
Message-ID: <6054@uqcspe.cs.uq.oz.au>
Source record: 236886

Can anyone help me with the following problem?
I have a Megafile 20 H/disk, 1040ST, tos 1.0 :-(
I also have PCditto2, and it has worked well for about 6 months.
Then I decided to clean up my H/disk, so I backed it up (2 partitions:
C=14K, D=6K; D contained all the PC stuff). Then I applied DLII, but it
munged the hard disk.
So I reformatted, using atari's HDX. Then I restored everything to the
H/disk. BUT Pcditto2 was unable to read any drives. The mesages from pcd2
looked OK, but when it tried to access disc D it couldn't read it. likewise
for C : and A:.
Then I thought I'd try to use the old software emulator, PcDitto1, and
exactly the same result occurred.
At one point, PCD2 said there was no vol label on disk D.
Does anyone have any clues about what to do? I've tried dropping the
keyboard, and also reseating chips - no good!
Is there some way to write a label onto the partition? Or is that not the
real bug? HH-EE-LL-PP!!

3669. PK fonts (size 12)

Newsgroup: comp.sys.atari.st
Date: 1990-12-01 22:23:22 UTC
From: <>
Message-ID: <1990Dec1.222322.9217@cs.utk.edu>
Source record: 236896

I can't seem to be able to find some PK fonts for showdvi, namely the
size 12 fonts.
The ones I need (and don't have) are (at least) cmti12, cmmi12, cmr12,
with resolutions 80, 96, 105, 115, etc. Does somebody have those, or can
somebody point me to a place where they can be found ?

Please let me know through e-mail. Thanks,

-andrew krzywdzinski (andrew@cs.utk.edu)

Kuma brought out such a gadget, and there were various magazine reviews about it and netters who discussed it. That's a bit more than a rumor. Probably didn't sell that many, though, as the Transputer isn't that impressive, IMHO.

>mean, come on, lighten up.

I'm not telling you what to do. I'm just saying that I've seen lots of flamewars in the past, and I haven't seen much of anything productive out of them. Stick around for a few years and see if you agree with me. Or go take a look in the Amiga and NeXT groups if you'd like to see a real live flamewar in action. When 80% of the postings are about something most people aren't interested in, the group dies for a while.

If I want to learn about other machines, I read their group or I go see one in person.

3672. Portfolio <=> ST

Newsgroup: comp.sys.atari.st

Has anyone figured out how to transfer files between a Portfolio and an Atari ST with the parallel interface? I've tried running FT.COM from PCditto 1, but cannot establish a connection.

Seems weird that I can transfer to an IBM machine, but not an Atari machine!

A .TNY file is a compressed Degas or Neochrome picture.

- Where can I find .tny files?

Usually anywhere. Atari.archive may have a few. They are only
16 colors, so they're not as popular as Spectrum 512 pics.

3674. STE's in Europe..lack of SIMMS

Newsgroup: comp.sys.atari.st
Date: 1990-12-02 01:10:38 UTC
From: dh@tardis.cs.ed.ac.uk
Message-ID: <sent.Sun.Dec..2.01
Source record: 236887

A response from Atari on this one please!

Here in Europe, Atari are now shipping some STE's with soldered in RAM.
Forgive me if i'm wrong, but was one of the plus points of the STE not the
easy memory upgrades using SIMM's?

I reckon Atari are peeved that people are buying 520STE's and pluggin in
extra SIMM modules. Atari would rather people buy the 1040STE.
However, there is no difference between the 520STE and 1040STE apart from
the larger memory...so why splash out extra dosh for a 1040STE?

I reckon Atari have dug themselves into this hole. The basci hardware of
all their machines is the same...face it...there is absolutely no
reason to buy a 1040STE.

But why do Ataari have to go and spoil it and solder in ram. It's going
to confuse memory upgrading even more.

On a different note, I've just bought the new SIMM Ram board for my normal ST
from Evesham Micros here in the UK. It costs 89 UK pounds wheen it commes with
2x256K simm's which upgrades a 520ST to 1Mb of ram.
This allows me the easy-upgradeability of the STE range (hah!).
I can currently get 1Mb simm's for 30 pounds....s to upgrade my ST to
4Mb would cost me 120 pounds in the future.

Hmm..why would a Mega 4ST cost me hundreds more <grin>
Time for some price reductions Atari!

Rich

3675. arc 602 (was Hackman II)

>involved, and deleted each file, and did a zoo x.// (or whatever it is) and
>it extracted with subdirectories.

What's wrong with arc 602? It is so automatic it isn't even funny.
It will create the needed subdirectories "anchored" in the current
directory without any extra commands, just: "arc x arcname",
quite a far call from zoo, and it's archives are more compact than
zoo's too from the tests that I've done. I especially like the
fact that arc is compatible in the DOS and Mac environments too
since I have a consulting job which uses these. Anyone interested
can find it at atari.archive.umich.edu under the atari/utilities/archivers
directory. I highly recommend it.

I have done extensive business with MicroTyme, and have *never* had a
problem with them. Except that I got the British version of Populous,
and the mail-in warranty card had an address in England printed on it...
big deal. :-)

However, I would *NOT* ever mail order anything as expensive and fragile
as a computer. I wanna go home with the thing under my arm, with a full
receipt and everything. Of course, this requires a local computer
(Atari) dealer.
It's just another example proving how f**ked up Atari is lately.

thaanuj@prism.CS.ORST.EDU (John Thaanum) writes:

- For one thing, everybody complains that support from atari is
- terrible and dealers can't seem to get anywhere with atari. Perhaps
- these "dealers" are the kinds that have one or two ataris in the far
- corner. IB Computers is atari only, they do big volume, and atari
- seems to grant them their every wish. If these other struggling
- dealers would try to stock enough inventory to make it worth atari's
- while to support them, the support would be there.
-
- All I know is that at this particular dealership (there is another
- IB store in Portland, OR which I have never been to) I get great
- service, lots of selection, and pleasant discussion about the world
- of atari computers.

This is the same in the San Francisco Bay Area. I hear good things from Houston. I also hear of great Atari support in South Carolina from Sheldon Winick's Computer Studio dealership. He has MS-DOSers come in his store wishing they had support in the area like the ST does. From what I understand, he has walls of software and all hardware on display. Some dealers, like the one I frequent in the Bay Area, won't display (but will order on request) Atari's 44meg removable which a lot of customers don't have the interest in or the cash for.

A lot of the stuff I buy from SF is at or below mail order cost. This is because I support him. I give him copies of the latest European demos, share rumors with him, and buy stuff from him. There are at least 3 more dealers within an hour of him, not to mention a few MIDI stores which sell Atari products. If you support your dealer, he will support you. For some, this seems hard to believe, but it works with very little effort.

There's ******* NO DIFFERENCE ******* between the Microsoft Bus and serial mice. The mice are identical. You can take a serial mouse, and plug it into a PC bus card with no problems at all. (I have done this, and vice versa)

I've posted the directions on how to do this several times. Is there a FAQ for this group? If so, then maybe it can be stuck in there, or uploaded to the Atari archive.

I have DC Xtract 2.0 from Double Click Software and it's pretty good. It's the only archiver for the ST that ZIPs files (there are others that unZIP). It also has ARC, LZH, and ZOO, although as I discovered tonight with HacMan II, the extract ZOO function doesn't extract to directories, even though I had the create directories set to yes. It doesn't have TAR built-in however. You may be able to work something out with ARCGSH 3.2; I'm not too fluent with TAR or ARCGSH though.

This was done some time back by a company called Triangle if i
remember, and you could add extra Inmos T800, to get more mips
but you still get the limmited ST's screen resolutions, if it was
worth while the othere add on would still be here, i do have a Magazine
with the Triangle unit in, plus i think a review, will post if wanted..

> Basically, when I booted up (and startgem Neodesk), any attempt at
>launching a program resulted in it being listed.

A fair few people expressed an interest in an answer to this 'problem'.
Thanks to 'Bob The Schulze' for telling me what was happening.

Something I forgot to mention in the original article, was the fact
that at the time, my left mouse button had failed (as per Atari mouse usual).
I resorted to using the ALT alternatives. It seems that Neodesk has a feature
to list any filename, and guess how you do it? Yep, by pressing ALT. So the
only way of launching a program is with the mouse (which is okay, as long as
the mouse is working).

I should have read the manual more closely. I still think Neodesk is
wonderful, and I expect to be upgrading to v3 very soon.

Lee.

From: silvert@cs.dal.ca
Message-ID: <1990Dec2.154127.23475@cs.dal.ca>
Source record: 236892

I recently bought a Mega-2 (via good old UseNet) and find when I
install it the screen display on my SM124 monochrome monitor is
appreciably smaller than the display I had with my 520. I've seen
reference on the net to complaints about the black borders, but I never
appreciated what the noise was all about, so I didn't pay careful
attention. If someone can enlighten me on the cause and any possible
fixes (I recall mention of a program called bigscreen or somthing like
that), it would be appreciated.

Not precisely, although the .TNY format is, like Degas and Neo, specific to the ST. The Tiny format was invented by David Mumper several years ago. The compression algorithm is especially suited to the interleaved bitplanes of the ST's screen memory, so Tiny format pictures are much smaller than their uncompressed and Degas-compressed counterparts.

For a detailed description of the Tiny format, consult the Picture Formats List, posted here periodically and archived at atari.archive.umich.edu in atari/graphics/picfmts.doc.

I lost the thread on how to format your
hard drive so you can get it to be recognized by a Mac
and Spectre 128. My only hope of getting any files to
D my computer is by transferring using a hard drive, so I
erased a 60 meg disk and when formatted on a Mac it
won't read on the spectre and vice versa. Is there a
foolproof way of getting It to read and write on both?
D I don't even care if there is no TOS partition on the
disk. Does it matter which atari formatting/partitoning
software one uses on the atari end (ICD, supra)? My
chance to use the CD rom at work is going to evaporate
D replies through e-mail. I have access to most formatting
software on the Mac so if there is a fairly bulletproof method
I'd like to hear about it.
soon so if there is a fairly bulletproof method I'd like to know
about it.

>zoo's too from the tests that I've done.

Well, I was afraid that most people would have old versions of ARC that could not unpack archives made with arc 602. I spent about 5 hours trying to find the best way to archive the game (remember, it's 700K+ of data and it must be unpackable on single-sided drive systems with 1 meg), and came up with the following: I took the data and made two .LZH files (one for disk1 and one for disk2), then converted them to self-extracting LZH archives. (Thanks to Todd Miller for that suggestion.) Then I archived those two self-extracting archives into an LZH file, along with a short doc file explaining that DISK1.TOS and DISK2.TOS are in fact self-extracting.

I think this is probably the best approach because:

a) It's very hard to mess up the unpacking. (In particular, no problems are caused by the desktop upper-casing all the command line args.)
b) It works on a single-sided drive (i.e., no hard drive) machine with a 600K RAMdisk.
c) LZH compresses far better than ZOO or ARC (at least the versions I have). The .ZOO file was 335K while the .LZH file is only 255K. The ARC file was over 300K too.
d) LZH files unpack faster than ARC and ZOO files.
e) You don't even need an .LZH unpacker that knows about subdirectories, since the subdir archives are self-extracting. Even the most primitive LZH unpacker should be suitable.

You can get all the tools you need to do this from atari.archive.umich.edu. The Lharc and SFX (self-extracting archive) utilities are all in atari/archivers. (SFX is by Stefan Gross and is really great -- try it!)

Hope this saves others some work...

Hello Everyone!

Well it looks like I have just a few remaining 1040STe's left. So, this
is the LAST CALL, once there gone, there gone FOREVER! These are brand new,
never opened out of the box.

These 1040STe's are going for 500 bucks a piece. Thats el cheapo!
If you want one, tell me where to ship it, C.O.D. and you can have a
machine that is easily expandable SIMM memory, stereo sound, 4096 colors!
What an XMAS present, plus you can help me get my money back so I can
pay for school next semester!!!!

I must admit TOO, they are ticking my roomate off since its kinda hard
to store all this shit in my dorm! Its not so bad anymore though, thanks for
those who have bought them, before....!!! :)

Well....must go! Talk to you later.

I my GTS-100 drive wouldn't boot Space Ace at all, so I figured it was the drive. When I got a second DS drive (a SF314), I still got stuck on the second disk in Space Ace. The disk just wouldn't boot.
Now I can't tell if it's the drive's or the copy protection or both.

Seems to me, nobody gives a damn about this kind of discussions any more.
They've happened too often to care about. They don't add anything new to
anyone's base of knowledge, they're not thrilling, they just bore people to
death.

Probably most of the people posting in support of Atari in the last couple
of flareups of this subject have kill files that work on article contents,
so whenever some article predicts imminent death of Atari Corp, they don't
even see it. You could try posting in Esperanto to get past these :-).

The point is - nobody cares if Atari dies or is bought by Commodore or
builds NeXTstations in agreement with Jobs or what. People here just have
gotten tired of it. I have too, so this is it. Luckily I'm using the nn
news reader so I can skip anything with suspicious Subject: lines.

Bye bye, gripers.
Martin

3695. TOS 1.0 40 folder problem and HD's

Newsgroup: comp.sys.atari.st
Date: 1990-12-02 22:05:54 UTC
From: system@n6vbg.hamavnet.com
Message-ID: <1990Dec2.220554.64@n6vbg.hamavnet.com>
Source record: 236804

Hello everyone,

I have a 1040ST with TOS 1.0, and megafile 20 (which I put apart, mounted the original ST225 and host adaptor in a different enclosure and added an ST251 for added storage).

Atari's hard disk software does not support the ST251 (or at least I couldn't make it recognize the extra space over the ST225) so I'm using Supra's hard disk utilities.

Now, I am familiar with the TOS 1.0 bug that limits the amount of folders per disk to 40. Atari used to supply a little utility that would fix that. DOes anyone know if that utility (I believe it was called FOLDR100.PRG) will work with Supra's hd utilities?

Thans in advance,

Russell Ochocki writes, concerning an STe he ordered in September:

>This is starting (as if it isn't already) to turn into an absolutely
>ridiculous situation!! Is Atari actually this negligent when it comes to
>supplying their dealers with products?

Perhaps incompetent would be a better word...

>Maybe this explains why sales for 1040e's are so poor -- nobody can
>get them from Atari.

Yes.. this is one reason...

>Or, is there something I don't know about the mail order company (MicroTyme)
>that I should know.....

No.. they're just another dealer at the mercy of Atari Corp...

>Anybody out there having any similar problems with Atari?

Yes... my local dealer orders four STs from Atari and receives one...
three potential Atari customers go elsewhere and buy IBM clones.

>I would appreciate any comments on this. Maybe one of those Atari guys
>who read this board could explain their distribution problems.

I'd like to hear that too.

Atari Corp has a tiny production facility and poor financial resources.
They stop producing one product line so they can crank out other products.
For example, they don't make computers for the Christmas selling season,
they make video games... thus, no computers in the pipeline.

Right now, I understand there's an extreme shortage of Mega ST4s..
although, you can now get the monitors to go with the Megas you can't
get, which themselves had been in short supply earlier.

Remember who you're dealing with. Your computer may show up at MicroTyme
tomorrow, or it may be "first quarter 1991"..

I retract my earilier statement that Atari ST is dying. What is dying is

1. Dealer support, and

2. Interest by the general computing public and major software publishers.

Outside of these two areas, there are lots of signs of strength:

1. There are plenty of ST periodicals. I just picked up a half dozen. Some of these are available at general computer stores (not just Atari dealers).

2. New software and hardware products and updates to old products are still being released. I've read reviews this week of 3 68030 upgrades.

3. Atari is still making and improving on the ST. The STe is shipping. The Stacy is shipping. TOS 1.4 is shipping. The TT and Mega STe sound darn close to shipping..e

4. There are plenty of mail order shops with lots of titles available.

No, the ST doesn't look like it's going to replace DOS or the Mac as the most popular computers. It doesn't even look like were giving the Amiga much to worry about. But why does that have to kill the Atari? Isn't there enough room in the market for a fourth computer standard? Just because the ST is #4 doesn't make it dead. It just makes it #4.

Owning a popular computer makes your life easier. More software, more dealers. But just becauase a computer isn't popular doesn't make it inferior. It just means you have to work a little harder to find the parts you need. But if you take that time, you may have a better computer than if you took the first IBM clone that got stuck under you're nose.

Yes, I'd love for Atari the be the most popular computer. I'd like there to be plenty of dealers, and Borland and Microsoft writing software for it. But those aren't the critical issues. The critical issues for me are:

1. Is there another computer that can do what I'm doing with my ST for less money?

2. Is there another computer that can do what I'm doing sufficiently better to justify paying more than I do for my Atari ST?

3. Is there another computer than can do something my Atari can't, and is worth paying more than I do for my Atari ST?

I think the ST/TT family can survive as a #4 computer. I think there are enough users and developers out there that I'll continue to find the software, hardware, parts, and support that I want and need. It may not always be as easy as with an IBM or Mac. But with a little work, I can have a better system

for less money than with either of the big two.

Source record: 236823

A couple of days ago I posted a positive message about supporting your local dealer and how, basically, you'll be better off than mail order.

I guess I have it lucky though. An STer I know sent me mail describing some of his unfortunate interactions with his local dealer. I know that there are a lot of bad apples in the bunch. Part of this stems from the fact that if you have one Atari dealer in a town (or MS-DOS or Mac for that matter), he can pretty much do and charge whatever he wants. I suppose the only thing you can do is tell the dealer this and tell him that you're going to do your business elsewhere. If you and others go to other dealers, soon the dealer will be out of business and it will be his problem that he charged so much. It's a tricky situation, like chicken and the egg I guess. Oh well, such is life.

Happy computing. :^Z

>
Hello Ed,

ConsFix 1.3 (latest version!) fixes 2 problems...
- If you are using a shell like GEMINI / NeoDesk... and also use QuickST or TurboST you run into trouble if you use the GEMDOS redirection. The Consws and Fwrite(stdout) Calls are not written into the Console window or into a file, but are 'speeded up' by QuickST / TurboST.
This is the first problem ConsFix patches.
- QuickST does not save the Register A2 while GEMDOS-Calls. The TurboC compiler (wrongly!) assumes that the register is not changed and so you often get bombs, when using programs that are compiled with TurboC an QuickST. This A2-Fix is the second patch in ConsFix.

The version 1.2 doesn't work with TurboST > 1.6, so please check the version is 1.3! ConsFix must start bevor QuickST in the AutoFolder. I am writing the english docs....
I have written another patch program: VdiFix patches an error of the v_opnwk/v_opnvwk call. Under certain conditions the same handle is assigned to every newly opened VDI-Workstation. This error is found in every TOS except TOS 1.2.

Sincerly, Karsten

Cross-posted to: comp.sys.atari.st,misc.forsale.computers

billm@CSUFresno.EDU (Bill Mills) writes:

- Stitchmeister is color program for creating patterns for
- counted-crosstitch out of 16 color neochrome images. This allows
- the happy stichmeister user to digitize photos of things like family
- members roses, etc. in color or 16 grey levels (which tends to work
- best), and then print them out as a pattern for counted
- cross-stitch. (those little stitched homesweet home, etc. signs
- that look so homey) This allows for interesting photorealistic
- decorations.

And they say there's no software for the ST.

Talking about a niche market. Or is that a 'stitch' market?

Will Atari go after this lucrative market now? Will they start
advertising in 'Stitching Today' magazine? I can see the Stacy ads
now!

Will Atari be present at the National Stitching Convention?
Damn, look what Elie missed!

Get out those knitting needles, Uncle Jack!

Hey R&D, how about a Sewing Machine Digital Interface? You'll have
all the true ST enthusiasts making their own clothes!

- Stitchmeister Demo may be distributed freely, so long as it is not
- put to commercial use.

Geez, I'm glad there's no fee for using the demo!

(I'm truly sorry if I offended anyone. I couldn't resist the attempt
at humor. :^)

^^^^^^^^^^^

MicroTyme is my local dealer (if you call a hour away local) Anyway, I have had no problem whatsoever with them. The one time I had my ST repaired it only cost me $45, including the $15 fee to get them to look at it to give me an estimate. (I blew up something in the parallel port, but thats a different story)

But I would suggest digging into the problem further!

p.s. As a side note to this, my roommate is currently in the process of buying a 386sx clone. He orignally ordered from DAK, but after a month or two of not getting his computer, he ordered from PC Brand, and its been getting close to a month on that order too!

Re: the Mouse Cursor Limit Problem

As you may recall the problem was how to reset the limit
of the mouse cursor travel after resetting the screen from Medium
resolution to Low resolution.

First, it seems clear to me from the help I received that
there is still no support for absolute mouse addressing in GEM/TOS
1.4. Apparently, only relative mouse returns are processed
and the travel limits are within GEM/TOS itself. I have been
informed that it is possible to reset the limits by using a
"change cursor" command on the VDI level, and at first I thought
I'd received enough information to do this. Upon reading the
information I received, I did not have sufficient information.
I do not have the Pseudo-Op code number and the definitions for
parameters passed and returned in the various data structures.
I thought about pursuing the matter further, but decided against
it. The program which required this setting is "functional" and
I have decided not to continue cleaning up the code for publication.
Rather, I have decided to put my time into developing my original
longer term project for which this program was necessary.

My thanks to all who responded!

Re: Sprites

And now on to the next, and hopefully my last problem along
the way to producing this main project. In this case, I have almost
all the technical capabilities to finish the whole project! Almost.
However, I've run into a very unexpected problem. As you may
recall, I wrote a number of Line-A bindings for the earlier
project and they were all successful. So looking at the Line-A
calls for the drawing and undrawing a sprite, I expected no
particular problems. Indeed, when I looked a the description
in "Atari ST Internals", it looked like a particularly simple
problem.

Draw Sprite:

Entry Conditions:
A0 = pointer to sprite definition block
A2 = pointer to buffer
D0 = Hot Spot X
D1 = Hot Spot Y

The Sprite Definition Block:
Unsigned shorts:
1. X offset to hot spot
2. Y offset to hot spot
3. Format 0 = VDI, 1 = XOR
4. Backgrnd colour
5. Foregrnd colour

followed by 16 pairs of shorts making up a set of bitmaps

background, foreground, (first row)
background, foreground, (second row)

etc.

The Buffer has a different format, but it's unimportant.
Simply stated, if it's 266 bytes (or 133 shorts), then it's
big enough to hold any data expected.

The Undraw Sprite definition was even simpler. Only
the pointer to the buffer is passed in A2 according to the
book.

So, I wrote the following:

```
.text
.globl _sprshow
_sprshow:
; void sprshow(sprite,buffer,posx,posy)
; short *sprite;
; short *buffer;
; short posx;
; short posy;
;
; Show sprite with "hot spot" at posx/posy
; Line-A support module for Sozobon C by Jim Omura
;
;var 4 8 _sprite
;var 4 12 _buffer
;var 2 16 _posx
;var 2 18 _posy
;
link a6,#-0
;
movea.l 8(a6),a0 ; A0 = Sprite Def Block
movea.l 12(a6),a2 ; A2 = Sprite buffer
move.w 16(a6),d0 ; D0 = X
move.w 18(a6),d1 ; D1 = y
;
.dc.w $a00d ; pseudo-op
;
unlk a6
rts
```

```
.data
; *** End of SprShow ***
.text
.globl _sprhide
_sprhide:
; void sprhide(buffer)
; short *buffer;
;
; Replaces Sprite with Buffer stored by sprshow()
;
; Line-A Support module by Jim Omura
;
;var 4 8 _buffer
;
link a6,#-0
;
movea.l 8(a6),a2 ; A2 = buffer address
;
.dc.w $a00c ; pseudo-op
;
unlk a6
rts
.data
; *** End of SprHide ***
```

It all looks nice and simple, but it doesn't work.
I crashed with bombs on the first attempt to "sprshow()".
I don't know if the "sprhide()" works because I never
succeeded to draw the sprite in the first place, and the
undraw command only works if you have the data stored.

It doesn't make sense to me that the actual routines
would not be working in TOS 1.4, and I don't think I'm being
particularly big headed in assuming that I made no mistakes
in my coding in accordance with the information in the book.
So the book is probably wrong. That would not surprise me.
In particular, I was surprised that *no* data has been sent
through the big A-Line data structure. It's possible that this
is correct. I don't see any reason to doubt it, but then
again, it seems like the place to look.

Does anybody have any information about the sprite
routines that contradict what I have?

3704. Alternative Networking

Newsgroup: comp.sys.atari.st
Date: 1990-12-03 03:36:54 UTC
From: jimomura@lsuc.on.ca
Message-ID: <1990Dec3.033654.20009@lsuc.on.ca>
Source record: 236817

After a lot of frustration with the workings of Usenet, I'm starting to get tired of it. I have STadel which is an offshoot of Citadel and it has networking capabilities. Some of the capabilities are a bit unclear. For example, the documentation does not state clearly if I can connect with Fidonet. Not that that's likely much loss. I wasn't impressed with the message content on Fidonet anyway. However, if anybody in the Toronto area wants to start building up an informal Atari ST network based on the STadel software, send me Net mail in reply to this message. I've been running the software for a year or so now and it's not wonderful, but it seems to be stable. I would like to set up a small set of overnight connections with maybe a couple of other Atari ST people.

Failing that, if anyone has some local Toronto BBS numbers for ST related boards, preferably with some reasonably intelligent people, I would appreciate receiving that much. The last BBS I was attached to folded some time ago.

Cheers! -- Jim O.

If anyone has the demoes of Deluxe Paint or Canvas, I'd like to play with them. Is it legal to send those around over the net? Would someone be willing to email them to me or post them on (what is it now?) what used to called terminator?

I had a guy lined up to do a show at our December meeting, but suddenly he is going to find himself on vacation (poor guy) and so now looks like I'll have to do it. Among other things I'd like to show off Deluxe Paint, but before I buy it, I'd like to compare the two demoes. Canvas got a lousy review in STart, I hear. Any net.thoughts on the matter?

3706. What happened to the Abaq/ATW??

Newsgroup: comp.sys.atari.st
Date: 1990-12-03 09:21:05 UTC
From: black_pd@darwin.ntu.edu.au
Message-ID: <1990Dec3.185105.437@darwin.ntu.edu.au>
Source record: 236838

Forgive me for asking about something that must be old stuff to most of you, but I'd appreciate it if someone could tell me what became of the Atari Abaq (or ATW?) - by e-mail, unless it would be of general interest.

I had been hearing about the Abaq for some years, then a year or two ago I read that the release of the ATW was imminent, and then it was never mentioned in the generalist magazines again... (or I just got busy). I gather that it was never actually released, but after hearing so much hype I can't help wondering why.

Thanks in advance from a new user of the net.

Paul Black / black_pd@darwin.ntu.edu.au / Northern Territory University

3707. Archive sites

My program ALT_BOOT in version 3.0 allows the use of up to ten different DESKTOP.INF files (in addition to managing the auto folder and accessories), so you can have one each resolution. It is available at serveral FTP-servers, I posted it to comp.binaries.atari.st serveral month ago.

Greeting, Thomas

PS: Perhaps there will be a new version in a few weeks, I got some new ideas.

This is a load of crap. Atari is always screaming about the FCC this,
the FCC that....FCC guidelines are published and most other manufacturers
seem to met them in a reasonable fashion. Perhaps, people should start
pointing the finger at the "engineers" who design Atari's products.
This is what happens when you try to cut corners and then try to
retro-fit the sheilding problem later on when you get busted.

Regards,

Chris

Source record: 236829

Since I had nothing but problems from the first mail order outfit I tried to get a 1040e from, I thought this time I'd look before I leap...

Anyone ever dealt with COMPUPLACE inc. (Downsview, ON) before? How long has the place been in business? Ever have any problems with them? When they say they have an item in stock, does that mean they ACTUALLY have it in stock (sounds strange, but the last place I dealt with said they had 1040e s in stock and they didn't)?

Any comments would be much appreciated.

3714. PC emulators for the ST

Newsgroup: comp.sys.atari.st
Date: 1990-12-03 16:25:19 UTC
From: alex@hpqtdla.sqf.hp.com
Message-ID: <15760001@hpqtdla.sqf.hp.com>
Source record: 236830

Hello,

I'm looking for some information about the experiences people have had with the various PC emulators that are available for the ST. I'm interested in both the "hardware and software" and the "all software" types.

I'll probably spend most of the time running CAD programs for electronics (schematic capture, PCB design and simulation) so graphics and speed are likely to be most important features. Some idea of how easy they are to live with would be most welcome too.

Thanks for your time,

Alex.

Finally! Someone who sums up the entire situation. I remember when reading
news was fun and most of all a learning experience. Seems like the quality
of people and information here is slipping a great deal.

Remember when you didn't need a news reader with a kill file? or nn to
sort through the trash and the good stuff. <sigh>

Maybe someday, comp.sys.atari.st will come back around to its intended
purpose in life: to discuss the Atari ST computer. In the meantime, I
guess we all have to use news readers like nn to get rid of the trash
that Bob Rotelle (and others) write.

That's not entirely true. This past summer, I worked for CalComp, and one of my responsibilities was some EMI testing. The VDE (German equivalent of the FCC) and the FCC have very similar requirements for radio frequency emissions testing (the levels are different, but so are the distances from which they are measured). The big difference is that the VDE is self-ceritfying, that is, if a VDE certified testing lab says you pass the limits with a certain margin, you can get automatic approval. The FCC, on the other hand, still requires that you submit results from a certified lab, but then they make you fill out some paperwork which takes approximately 3 months to process. You don't know if they will decide to check your results until they process the paper. Then it can take an indefinite period of time for them complete their own testing before giving you FCC certification. It is entirely possible that Atari didn't do anything at all wrong (or even questionable) this time, but given their track record, the FCC decided they'd be a good company to spot check. It might also be that the lab they used is being spot-checked.

I believe that Atari met the FCC guidelines for the TT and was just waiting for the paperwork which _should_ have come back before Comdex. This is just a guess, though. Undoubtedly, the TT is shipping in Germany and the rest of Europe because it has VDE approval. Let's give Atari the benefit of the doubt on this one.

GramSlam is the only grammar checker for the ST that I know of. It's available from:
Phil Comeau Software
43 Rueter Street
Nepean
Ontario K2J 3Z9
Canada.

I am told that it is somewhat similar to Grammatik for the PC. I cannot comment on it since I haven't used it; and I SHOULDN'T comment on it since I know Phil slightly ......
As someone mentioned, there is a demo at atari.archive.

Roger

Bob Brodie reported at the Atari Safari in Houston that the ATW has long since left the public eye and is aimed at big research groups. Although he would not name which companies are using it, he did assure us that that the ATW is real and is in use, just not on the public forem.

>That's not entirely true.

I didn't mean my point of view to be considered "entirely true." I am just pointing out that Atari has pulled the FCC-is-holding-us-up stunt so many times in the past that maybe (just maybe) the fault lies at Atari. How many times can you tell your teacher that your dog ate your homework without finally taking the blame for not doing it? :-)

Besides, even the stuff that did pass must've been marginal. My old 1040ST used to create snow on any TV I was watching in the same room. Of course, matters didn't get much better when I removed the RF shielding to make room for my RAM expansion board. :-)

Hmmm, I was under the impression that German RF/EMI leakage standards were
tougher than those set by the FCC. That is what always boggled me about
Atari's griping about the FCC. You'd figure that a company who gears its
products for the German/European market would use their stricter standards
when designing their products.

Realy??? How much?

Just to piss glh off...I saw a demo of the new NextStation today. Someone
earlier mentioned that the windowing system was very slow. That doesn't
seem to be a problem. Seems that when you throw a 25mhz 68040 at the GUI,
it seems fine. I didn't notice any slowness. However, the machine wasn't
running THAT many tasks at the time either. The educational pricing makes
the thing so cheap that you could throw in the NeXt 400dpi laser printer
too and have a very nice unix system with scads of included software at ~$4500.

Hai There,

Currently I am considering purchasing a CAD package for my Atari. But before
I plunge ahead I like some more information about the following packages:

BeckerCAD
Drafix
BETA CAD

So if there are any users of these programs that read this could you give me
some feedback. One thing I wonder about is the import/export of drawings
to AUTOCAD format. Also for anyone familiar with the SKETCH program from
AUTODESK, how do the above programs compare with it.

Thanks in advance,

Martin Siebert

BTW my system is a 1040st with a 40 Mbyte HD.

As another point of reference, I was just in my local Atari dealer's store this weekend (we still have one here!) and asked him if he was going to be carrying the 1040STe's. He said they'd be carrying them whenever Atari got around to shipping them the ones they'd ordered, and also said that they haven't been able to get any monitors from Atari at all...something about Atari changing brands or vendors or something on the color monitors, and having hit a snafu, so that the warehouse has no monitors of any sort to ship now...should make for an interesting Christmas season!

>I need help transferring files from a NeXT CubeFloppy to a MegaST-2
...
I use the program IBMFMT by Moshe Braner. An equivalent program is PS2FORM.
Both are free.

I frequently use disks formatted this way, or formatted with the PC, to
write files with PC, read with ST, and to
write files with ST, read with PC.

For casual use, you should limit the number of such disks on the Atari
to ONE disk, because the ST system gets confused by the fact that all
PC volume serial numbers are the same. If you really have to use two
different IBM formated disks *in your ATARI ST*, insert a floppy that has
been formatted from the desktop of your ST in between. That way, the ST
will know that disks have been swapped, becauze the serial numbers will
be different, both times, once changing from a PC disk to an ST disk,
and again from ST disk to PC disk. (Think if it sort of like double
clutching. :-)

I can not say much about the NeXT system and how it interacts with
the PC. I suggest that you experiment with a real live PC with a
couple of simple text files.

3735. TeX help - printing .DVI files

Newsgroup: comp.sys.atari.st
Date: 1990-12-04 03:42:33 UTC
From: dlk0ms9s@umiami.ir.miami.edu
Message-ID: <1990Dec3.234233.7471@umiami.ir.miami.edu>
Source record: 236847

I am posting this mesage for a friend, please direct all replies
via email to his address, which I will post at the end of the message.

Message Follows:

I have finally gotten just about everything I need to get TeX running
on my 1040st. I have run some .TEX files through LaTeX and gotten
the appropriate .DVI file, and used SHOWDVI to view it.

Now, the only thing I cant seem to do is print it out.

I have the dviprint file, but I don't know if I have the right fonts,
or if I have them in the right places. I have tex on drive e: in the
directory e:\tex\.. in that i have the \macros and \tfm, and I have a
folder called \showdvi which containt the dviprint program. Now what I
need to know is what kind of fonts is the dviprint looking for and where
do I put them? I have a bunch of pkxxx fonts, which there is a reference
to in the docs for dviprint (not very thorough documentation.)

I got the dvifnts1 and dvifnts2 from atari.archive and unzoo'd them,
which created a directory called \fonts which has a structure like this:

\fonts\cmr10\pk100
\cmx20\pk230

and stuff like that.. any help would be appreciated. I am willing to
do this by phone, I will pay for the call, of course.

Thanks

-Frank Rachel

Just to continue this non-ST discussion....
Please explain your $4500 price. Someone posted the NextStation educational
prices a couple days ago. I believe a usable system came in around $5000
for mono and $6500 for color - and that is without the 400 dpi printer you
mention.

I have to agree. I had been planning on upgrading my ST to 4megs to run the GNU stuff, but I've decided to save the money for another machine. Personally, I'm partial to Sun and their prices are getting better all the time. I had wanted a NeXT I don't think it's going to make it either. With the new Sun SPARC 2 announced, the market for SPARC 1s will open up to us low-end types.

I don't think I could ever buy an IBM drone. They have definitely overtaken the ST in raw computing power but I still don't think much of the architecture nor the OS and I don't like Intel chips.

An apple is a possibility, but it too is limited and pricey as well.

Power without the support isn't worth any price.

>Recently, Bill Gates, in defending the PC versus NeXT and Mac, said "What is
>there that you can do on those machines that can't be done on the PC." I think
>the same (almost) applies to the ST. I can't think of anything that can be done
>on the PC, or Mac that you can't do on the ST.

This issue came up recently with AREN. We are trying to develop an information service for multiple simultaneous users. Currently the service is piecemeal with some on Unix boxes (not ours), some on a PC, some on CIS, and some on an ST. We are trying to decide how to integrate this into on managable entity. Once person really wants to develop the who thing in DOS. I had though briefly about some form of Atari, but quickly dropped the idea since I didn't think we could depend on Atari being there. The problem came down to this. On the PC we had to build all of our Communications, Tasking, and Terminal interfaces from the ground up. On a Unix box we could rely on the OS and its libraries to provide these facilities -- we only needed to worry about the application.

PCs and STs don't make very good Unix hosts, though 386en are getting better. A machine built with multi-tasking in mind tends to be cleaner.

For our needs a PC or ST just doesn't cut it. A Mac would only be used to layout our newsletter and brochures (but I wouldn't pay Apple for A/UX.) The TT provides Unix, but at what cost. We know that Sun is going to support us and there is a 3rd party verdorship out there. Can the Atari promise that?

My ST is a fine smart terminal and a good typesetter with TeX (but it is slooowww).

For want of a nail....

>> They've happened too often to care about. They don't add anything new to
>> anyone's base of knowledge, they're not thrilling, they just bore people to
>> death.

I dunno about that. Seems to me that it is a unique opportunity to let
the various companies know how you feel about their products/strategy in
a timely fashion. Hey, if they don't like what they're hearing, then
maybe they should change their ways?

>> gotten tired of it. I have too, so this is it. Luckily I'm using the nn
>> news reader so I can skip anything with suspicious Subject: lines.

Hey man, if you want to stick your head in the sand and ignore what is
going on around you, that is fine. That is your right. But trying to
intimidate others to do the same is wrong. If you'll notice, it is
the supposed "cheerleaders" who usually use the foul language and insulting
tone.

>Finally! Someone who sums up the entire situation. I remember when reading
>news was fun and most of all a learning experience. Seems like the quality
>of people and information here is slipping a great deal.

Yeah, it used to be fun when there was some sense of life in the Atari
computing world. However, as the ST's fortunes have faltered, so has
the interest in talking about them. If you'd like to increase the
S/N, why not post some decent articles once in a while instead of
whining about the people you don't agree with. As an example, I
would point towards Dave Haynie at Commodore. Check out comp.sys.amiga
sometime and get a load of the wealth of straightforward information
he provides to users on a regular basis. Take a look at all the people
who post from Commodore and Apple on their respective groups. Atari
people have pretty much dropped out of sight, except for an occasional
message here and there.

>Remember when you didn't need a news reader with a kill file? or nn to
>sort through the trash and the good stuff. <sigh>

Well, if you choose to limit your scope by filtering people out, that
is your business. I prefer to read all the articles so that I get
a balanced point of view, rather than just the views of those I already
know agree with me.

>Maybe someday, comp.sys.atari.st will come back around to its intended
>purpose in life: to discuss the Atari ST computer. In the meantime, I
>guess we all have to use news readers like nn to get rid of the trash
>that Bob Rotelle (and others) write.

Maybe someday Atari Corp. will come back to life and there will be
something interesting and exciting to talk about for a change. As
for considering dissenting viewpoints trash, I would say that is a big
part of the problem with yourself and Atari Corp. Maybe you should
do more listening and less blustering.

>--
>John Townsend ames!atari!towns
>Atari Corporation
>"I know I need something.. I just don't know what it is!"

A more balanced perspective I suspect....

Cheers,

Chris

On Fidonet, the first commandment is "Thou shalt not be excessively annoying." I'd like to suggest using the same standard here on usenet. Chris Mauritz only seems to post stuff saying "Atari is lousy. I told you years ago that Atari is lousy. Anyone who disagrees is silly". (He used to claim to be a financial expert until he publicly failed to notice that Jack Tramiel should be considered an Atari 'insider'). I say enough is enough. He's getting not just annoying, but excessively annoying. As of the next dumb, provocative, insulting message I'm mailing to postmasters between him and me asking them to cut him off. I suggest other people might consider doing the same. Note that he's the only person posting to this group that I'd say that about.
Steve J.

>Of course, matters didn't get much better when I removed the RF shielding
>to make room for my RAM expansion board. :-)

My favorite was always Emacs, which, when run from within Forthmacs, generated noise on my AM radio. I'd be working away, listening to the ballgame, but as soon as I netered Emacs, I got static. Not on disk access, mind you. The character read loop apparently went through exactly the right instruction sequence to generate noise at just the right frequency to interrupt KSFO.

3745. Re: ARC 6.02 doesn't warn when out of space!?

apratt@atari.UUCP (Allan Pratt) writes:

- I have ARC 6.02ST and I found out last night that it doesn't tell
- you when it runs out of disk space! Freeware buyer beware!

Right-o! This is what Sentinel, from John Eidsvoog, is for. It checks during writes to see if there's space left; if not, it puts a dialog box up. It was written specifically for ARC 6.02 and another program whose name slips my mind at the moment, which doesn't check for full drives.

Looks like another program I'll be sending to atari.archive. Look for it in a couple of days.

>it just doesn't do it. Any ideas?

I don't have a problem...often. Seems like I do have an occasional
problem, but but have always blamed it on TOS (1.4). Of course, I
never bothered to look into in much. It's not repeatable. Hit reset,
hold <alt> (so no files are changed), occasionally repeat again, and
it comes up fine.

I just don't use low res often enough to worry about it, but I'm
giving you my experience.

I decided to buy an Amiga and upgrade my ST to the STE! This way I get
the best of both worlds! But what really dissapoints me is when TAF decide
it wont host an annual Computer Show! Now whats even more discouraging is
when Atari Canada cant even put on a show like the WOC show this past weekend
I cant believe Atari isnt supporting one show in CANADA for the year! I cant
believe Commodore is outdoing atari when I know the ST is a better computer
Its time we call a few numbers and let ATARI hear their one liners have
to turn into action or I for one can convert 250megs of ST files into
Amiga files real fast

From: art@maccs.dcss.mcmaster.ca
Message-ID: <275C1435.21859@maccs.dcss.mcmaster.ca>
Source record: 236763

Hello All,
A friend of mine bought WordUp 3.0 and can't get it to print.
He has a plain 1040, mono monitor, and Hewlett Packard IIP laser
printer. He tells me there is are two ways of printing: a Text
driver (doesn't work) and a Migraph GDOS driver (also doesn't work)

He has heard of a product called "Turbo Jet" and wonders if that'll help
him out of his fix.

He's tried calling Neocept, but got nothing but an answering service
His version is "Wordup 3.0 08/28/90"

Any suggestions from experienced Wordup Users out there?

Please email any thoughts to me. Thanks!

bill@mwca.UUCP (Bill Sheppard) writes:

- I've been unable to make the autoboot feature of Superboot 6.0 with
- TOS 1.4 work properly - anyone know if this is a TOS limitation? It
- works in medium rez, and in low rez DESKTOP.INF does have the
- filename I want to autoboot, it just doesn't do it. Any ideas?

I had problems with this at first too with both resolutions; perhaps this may clear things up though. (I'm assuming that TOS 1.4 and 1.6 write and read DESKTOP.INF *identically* because I have 1.6.) It seems that Superboot likes to write #Z 01 C:\AUTO\NEOLOAD.PRG@ (this is the line that tells Rainbow TOS which program to autoboot) at the top of DESKTOP.INF instead of on the fourth line where the desktop writes it when you 'save desktop.' So to avoid the confusion, I edited both med and low res DESKTOP.INF files so that the #Z line is fourth. Therefore, instead of Superboot writing the #Z line, it's always there in DESKTOP.INF; if I don't want anything autobooted, I just hit HELP and then F3 to disable the autoboot.

In short (what I should have said at the beginning :^), make sure that the #Z line is the fourth one in DESKTOP.INF. I hope this works.

BTW, I rarely save the desktop, even with NeoDesk's .INF files. I find it's easier to just edit the files in a text editor.

Cross-posted to: comp.sys.atari.st,misc.forsale,misc.forsale.computers

I'm not sure this made it to the net before, so I'm posting it again. If you have seen this before, please accept my apologies.

Here is a bunch of stuff, new and old. Some of the stuff is still in original shrink wrap, some of it is open. To the best of my knowledge, everything works (as it was originally delivered). All sales are final. Where applicable, the shrinkwrapped items will be distributed first. Shrink wrap items will be distributed to the first callers.

I would prefer that you e-mail your inquiries. Call if you must, but please be aware that I am seldom in the office. All prices are what I would like to get out of the stuff, but I'll dicker if you want.

Here goes...

(quantity is in parentheses)

Hardware: (all used except for the mice, Drive B, and Z-times)
(price for each)
Atari SF354 diskette drives: $35 (4)
Hippovision Frame Grabber: $25
Navarone flatbed scanner: $500
Atari 520ST: $150
Z-time/ST $5 (2)
Drive B (switch to allow more than one B drive)
$10
Paradox 5.25" disk drive $15
Atari mouse $10 (2)

Software: (all in original shrinkwrap except as noted, price for each)
Timeworks Datamanager $15 (1, open)
Timeworks Partner/ST $15 (2, 1 of them open)
Timeworks Publisher/ST $15 (1, open)
Timeworks Swiftcalc $10 (1, open)
Timeworks Wordwriter/ST $25 (1)

Beckmeyer Hard Disk Accelerator
$5 (2, 1 of them open)
Beckmeyer Ansiterm $5 (1)
Beckmeyer Micro C-Tools $10 (1)
Beckmeyer Micro-Make $10 (1)
Beckmeyer Micro C-Shell $10 (1)
Beckmeyer MT C-Shell $5 (2)

Dollars & $ense $5 (1, open)
Degas Elite $5 (3)

Red Alert $3 (1)
A-calc $5 (1, open)
Cyberpaint $3 (1, open)
Pha$ar $3 (1, open)
Spectrum 512 $3 (1, open)
Genesis $3 (1, open)
Flash $3 (4)
Shadow $3 (2)
Kermit & Remote Control $3 (2)
Macro Mouse $3 (4)

GST-C $5 (1)
Deep Space $2 (1, open)
The Pawn $2 (2)
PC-Ditto $5 (3, 1 open)
Michtron Juggler $5 (2, 1 open)
MaxPak $3 (3)
MS-Emulator $2 (1, open)

FirstByte FirstShapes $5 (1, open)
FirstByte SpellerBee $5 (1, open)
FirstByte KidTalk $5 (1, open)

IS-Talk $5 (1)
PC-Intercom $5 (1, open)
Golden Oldies $2 (1, open)
USCD Pascal $5 (1, open)
Music Studio $2 (1, open)
PrintMaster $5 (2)
PrintMaster Art Gallery $3 (1)
Art Gallery Library $5 (set of 4 disks, open)
F16 Falcon $3 (2)
Winter Games $2 (1, open)
Chat $2 (1)
Sundog $3 (1)

Issues of Start, brand new, at least two of each, *with* disk, $1 each:
1987 - Winter, Summer, Fall
1988 - Spring, Summer, Specials #3 & #4, Oct, Nov, Dec
1989 - Jan - Dec
1990 - Jan - April

That makes two of us. It was few months ago when I was waiting to
get the best word processing program with the best customer support,
in upgrade wise. I start from v1.and paid Neocept the upgrade
fee that now amounts the program net cost to and above $120
for me. I could have bought a word perfect. Anyhow, the program
that I thought would be one of the best word processor that
could be compared to that of Mac ones was not a complete program.
But a bunch of disks that wouldn't even let you write a resume.
I, csc major, wasn't able to use it! It is deep in my closet.

FEW MAJOR PROBLEMS WERE :

1. It will freeze when quiting the program.
2. Printing wouldn't work properly. It will sometimes print it
to the screen and bomb or just bomb.
3. Spell checking with a large file causes bomb.
4. NO WAY to append another WUP file!!!!!!
IMPORT WordUp was designed to accept older format and it would not
import v3.0 leaving no option to append but to open two window and
do window to window paste.
5. who knows

I am wondering if there is a person who is using WORDUP successfully.
I am wondering if someone know where Neocept is.
I am wondering if they will ever rewrite the sucker.
I hate to say I made a bad decision.
Rather I hate getting robbed!

>I got it from atari.archive and Todd Miller's description says that
>it fixes some problems with Quick ST and Turbo ST when they're used
>with Gemini and Rufus.
>

Hello Ed!

This program fixes the I/O-redirection bug. If you use the console-window from Gemini and on of those "softwareblitters" you can't direct the output from a program (a contents-listing of a zoo-archive for example) to a file or the printer port, because the new BIOS-routines of Quick-ST and Turbo-ST doesn't care about I/O-redirection.

Greetings, Olaf

3769. Basepage problems

Newsgroup: comp.sys.atari.st
Date: 1990-12-05 12:55:27 UTC
From: e21c10@titan.hts.hsa.nl
Message-ID: <1409@titan.hts.hsa.nl>
Source record: 236783

I have written a quite large program in GFA-basic to simulate analog circuits
(Kind of a Pspice- with the speed of an IBM XT). There's a routine
that's used quite a lot by the program, so I decided to write this routine in
C language. So far no problem .
However, I'm having some problems executing the C-program after it has been
loaded in memory. So I made up a small program just to test if the C-routine
could be executed . The GFA basic program :

```
RESERVE 10000+FRE(0) ! Reserve 10 k bytes of memory
adress = EXEC (3,"A:\PROG.PRG") ! loads program in memory, returns basepage-adress
start = LONG {adress+8} ! Starting adress of program
dummy = C:start() ! Execute C program
END
```

The c program :

```
include <stdio.h>
void main()
{ printf ("This is a C program")
}
```

However, this combination doesn't work. The computer just crashes, so I
suppose the adress ' start' is NOT the starting adress of the C Program.
My questions are :
1. What the hell am I doing wrong
2. What do the terms in the basepage mean ? (TPA, TEXT etc.)

If you have any suggestions to solve this problem , Please post me
Bye, Roland

>I'm getting a Mac IIsi if my parents can/will help me afford it
>(although it's pretty cheap here with student discounts, $3000 is still
>a lot of money) or a Spectre GCR if that's all I can afford.

$3000 is a REAL LOT of money. Maybe my STs aren't Macs, but I've invested all of $500 in my Atari stuff. I just can't see where buying a "home" computer for the price of a car is a good move, sorry.

>My favorite was always Emacs, which, when run from within Forthmacs, generated
>noise on my AM radio. I'd be working away, listening to the ballgame, but as
>soon as I netered Emacs, I got static. Not on disk access, mind you. The
>character read loop apparently went through exactly the right instruction
>sequence to generate noise at just the right frequency to interrupt KSFO.

My supercharger causes lots of interference with my cordless phone. There's
a little red "data" light which goes on every time my screen's contents are
changed (i.e. every time a character is written to a screen, or whatever).

So I have a corner clock on my computer, and the time changes every second.
If I'm on the phone, I hear high-pitched little beeps which last a
milisecond or so, almost as if a radar is scanning me or something. First
time this happened, I didn't know WHAT to do..

what's really fun though is when I am on the phone, and my idle screen
saver kicks in. All of a sudden the screen is filled with fireworks, and
every time a pixel is written to the screen, "blip"...

Actually, the blips in a strange way make the fireworks more interesting.
One time I was talking to someone, heard the noise and saw my screen, and
just stopped talking in mid sentence....

hello?

hello?

the person on the other end just heard some weird sounds, and almost hung
up on me....

Cross-posted to: comp.sys.atari.st,comp.sys.next

In article <1990Dec3.211612.2176@watmath.waterloo.edu> ljdickey@watmath.waterloo.edu (L.J.Dickey) writes:
| I use the program IBMFMT by Moshe Braner. An equivalent program
| is PS2FORM. Both are free.

I recommend FORMAT which, I believe was posted in Sept. It should be available from atari.archive. The major difference between FORMAT and PS2FORM is that a) FORMAT ensures that the floppy has a random serial number, while being MS-DOS (and for that matter SPARCstation) compatible, and b) it creates 3 sector FATs, thereby giving the user 2 extra clusters (the same as if the floppy would have been formatted on a PC). What more can one ask for?

| For casual use, you should limit the number of such disks on the Atari
| to ONE disk, because the ST system gets confused by the fact that all
| PC volume serial numbers are the same.

If you use FORMAT this problem is solved!! Virtually all my 100 or so Atari ST floppies are MS-DOS compatible. Until FORMAT came along I had to hack the serial number manually with a disk editor. :-(

Finally, FORMAT can format in the background if you install it as an ACC. Just don't use up too much CPU in the foreground, otherwise the formatting will come to a halt. Disclaimer: I didn't write it! For the moment, I'm just a happy user of FORMAT.

have just put the DM and CSB character editor on the atari.archive, so I guess it will be availiable for ftp sometime soon. If anyone has problems getting it, just mail me and I will try to help.

Thanks,
David Koski

3775. Stacy problems

Newsgroup: comp.sys.atari.st
Date: 1990-12-05 15:46:15 UTC
From: mjs@hpfcso.HP.COM
Message-ID: <7340044@hpfcso.HP.COM>
Source record: 236786

I finally got my STacy from a small semi-local dealer, and promptly noticed three things I don't particularly like:

1. The model I bought was orignally a Stacy 1, but the RAM was replaced with a SIMM module, with 4 MB. This was as advertised. What was not advertised was the sticker that fell off the case as soon as I picked it up, saying that removal /damage of the sticker voided my warranty. The sticker was apparently protecting a screw that JRI opened to install the SIMM's. Before I take this up with JRI, or the dealer (who did not "authorize" the modification - he ordered the box from another dealer who had already done it), does anyone know if I've been screwed like I think I have? Does JRI honor the warranty? I have no address or phone # for them.

2. My first problem that the voided warranty won't cover - if I have a MIDI instrument connected and powered on, Stacy won't boot. More particularly, she boots, displays the desktop, then immediately locks up. This doesn't happen if the MIDI instrument is turned off when I boot, so I can work around this, but it is annoying. I don't remember this happening on the Mega 2 I used to use, so I am pretty sure this is a bug, not a feature. Has anyone else expereinced this? Could I be doing something wrong?

3. The first piece of software I tried to run on, Mitch Bradley's Forthmacs, doesn't work correctly. Actually, it comes very close, but I seem to be unable to "save-rel" anything without getting a "Flushbuf error" - and there is plenty of space on the disk, and the disk is not write protected. I plan to take this up with Mitch, but it definitely is not a good sign. Hopefully it is something I am doing wrong, and not something funny about the Stacy or its TOS (called "Rainbow TOS" - is this the same as 1.4?)

3780. Atari Archive Monthly Posting

Newsgroup: comp.sys.atari.st
Date: 1990-12-05 17:28:37 UTC
From: weiner@terminator.cc.umich.edu
Message-ID: <1990Dec5.172837.27486@terminator.cc.umich.edu>
Source record: 236710

Welcome to atari.archive.umich.edu

This is the monthly posting from the umich atari posse. We hope
it will answer some of those nagging questions that always seem to pop up
from time to time. If you have any additional suggestions, please mail
them to me, at weiner@atari.archive.umich.edu.

1: How do I use BART?
Bart (Brode's Archive Retrival Thang) is our mail server. You can get
his help file simply by asking for it. Mail atari@atari.archive.umich.edu,
and type the word help in the body of the message. Further questions about
BART can be mailed to jon@atari.archive.umich.edu, NOT me.

2: How can I connect via FTP?
Well, we HAD a help file, but it was destroyed in the great AA crash and
I haven't yet had a chance to replace it. If you're interested in it,
please mail me and I'll rewrite it.

3: What if my machine doesn't support name service?
Two things to do here:1) Demand that your sys-admin install it soon,
and 2) use the internet address 141.211.164.8

4: I can't download because my hard drive doesn't work and my modem goes
out sometimes and .....HELP!!!
Sorry, outside of the archive I really can't help you....Your best bet is
to find someone at your site with a similar set-up, or post to c.s.a.st
for advice.

5: Excuse me, but your index sucks.....
I know, I know. I am working on it. Really. It's kinda tedious to index
148 megs of stuff. Please bear with me. The ls -lR index is updated about
two times a week, usually on Tuesdays and Sundays.

6: Oftentimes when I'm transferring files, I'll lose my ftp link and get a
host not responding error. What's going on?
Our regional host network called Merit (the name doesn't reflect anything)
oftentimes gets flaky. It's been that way lately, so please bear with us
It happens to us too.

There are a few files that you will find necessary to continued archive
usage, namely:

archivers/arc602.arc : The latest version of arc
archivers/zoo.arc : The classic archive program
archivers/compress.zoo : Useful for removing .Z from sounds and binaries
archivers/unlzh11.arc : Unpacks .lzh files

Some of the latest uploads:
README dlxpaint.lzh lha121.lzh rtvmse.lzh stno_103.lzh
artpak.tos dmeditor.arc mandltoy.arc sfx_lzh.lzh term4.lzh
artst232.lzh driveoff.lzh megaform.lzh sheet_20.lzh topdown.lzh
bit36_e.lzh dterm_1.lzh memfile.lzh shredder.lzh unisbgcc.zoo
calculat.lzh fujidesk.lzh miditalk.arc smeister.arc unitmacs.lzh
canvasdm.lzh gimmicks.lzh nx1000.lzh speak_ez.lzh unix2dos.lzh
cooltetris.arc hacman2.lzh parkhd.lzh st_whiz.lzh unixmode.lzh
dcfmt302.lzh ke22.lzh quickgif.lzh stkr_206.lzh ymg125.lzh

All of which may still be located in the newitems directory.
Thanks to everyone who has uploaded anything lately.....

PLEASE NOTE: FTP and BART service are a privelege, not a right! Please make
a supreme effort to keep heavy FTP and BART use in off-time hours (i.e. after
5 pm EST but before 8 am EST), especially FTP use.

THIS JUST IN: In an ever un-ending attempt to support atari users everywhere,
Scott Wood has recently added a new portfolio directory. Please send suggestions
comments, or uploads to him at swood@atari.archive.umich.edu.

Any ideas, questions, comments, etc. to me,
weiner@atari.archive.umich.edu

>Rather I hate getting robbed!
>
> Jong-Woon Kim

I am not sure whether or not I like defending WordUp or not, but I thought I'd give it a go... I have 3.0 and really like it...it is pretty much the only word processor for the ST that I have found that can do what I want to be able to do. It sounds like you did not get the "fix" to 3.0...I understand that caused many problems. So, as far as use goes, I like the program...what bothers me is that I have seen a fair number of people mention lately that they ave been unable to get ahold of Neocept...that is bad! Does anybody out there have any info on what this company is up to these days?

3788. Problems with PLAYER.LZH

Newsgroup: comp.sys.atari.st
Date: 1990-12-05 22:41:28 UTC
From: system@n6vbg.hamavnet.com
Message-ID: <1990Dec5.224128.65@n6vbg.hamavnet.com>
Source record: 236794

Hello, everyone,

I just received the files PLAYER.LZH and BART.SND from the atari archive site via mail.

I decompressed PLAYER.LZH, which created PLAYER.TTP, and tried to play the sound file. However...all I get is some vertical bars on the screen, no sound comes from the speaker, or anything else. I can abort the program with the space bar as stated on the opening screen (which flashes real fast !).

I tried the program both with my color and mono monitors, and I even put the two files by themselves on a floppy and tried them that way in case the player was not compatible with some of the stuff that gets loaded when I boot the machine from the hard disk.

Any ideas? Am I missing something? No docs came with the file, by the way.

Thanks!

>
>Townsend is a good person. If you keep it up, Bob, the quality of
>information on this newsgroup is going to decline even more.

I must agree with Greg on this.

Listen folks, if you have a gripe with the way Atari runs their
business, then write Jack and Sam and vent your spleen -- the employees
don't control the throttle of the Atari train. I would say that Atari
has their problems, but it isn't anything that has already been beaten
to death here n! times.

Have you folks ever thought that there just may not be enough folks
at Atari to do all the jobs that have to get done to keep the doors open
and get out new products? That would explain a lot of the problems that
have occured there over the years...

3790. Re: hard drives

Newsgroup: comp.sys.atari.st
Date: 1990-12-05 23:19:23 UTC
From: ekrimen@ecst.csuchico.edu
Message-ID: <1990Dec05.231923.2497@ecst.csuchico.edu>
Source record: 236723

- Need some advice.

The Doctor is in. Please have a seat. (Just kidding. Har har :^)

- I currently have a 520ST and want to purchase a hard drive. I am
- looking for recommendations on manufactures.

I think most people will agree that ICD is the way to go if you want the best. Most third-party vendors sell ICD host adapters so you can put together your own drive or have them assemble it for you. I have a Seagate 157N-1, a 50meg (okay 48.9meg), 28 ms drive. I've had it for a year and a half, treated it well, and it's worked flawlessly. I have it in an ICD case. I've heard that fans in other cases are kinda loud.

- Is it better to mail order or buy one locally?

If you have a good dealer nearby that has a good price, go for it. If this isn't the case, there are many places that will put together a drive usually with any size mechanism from any company. Toad Computers (800-448-TOAD) is a reputable place. So is Carter Graphics (801-628-6111). I bought mine from Joppa (800-876-6040). Joppa buys the host adapter and case from ICD and buy the drives from Seagate and assemble it for you. Ask your dealer if he will buy the case and drive separately and put it together for you, or you can put it together yourself.

- What are the standard prices?

A year and a half ago, I bought mine for $665. They now have the same setup for $579 (September, 1990 issue of ST Informer).

Good luck. If you have any other questions, drop me a line.

What I find most interesting is that when "Atari employees" or other
Atari Cheerleaders cannot find anything to say to defend Atari's actions,
they almost invariably resort to personal attacks...

Instead of trying to come up with some rationale for the way Atari does
things, or providing us with any hard facts, they call names...

Read back over this thread and see who brought it down to a personal level..

>>
>> I ordered a 1040e from MicroTyme (Kettering, Ohio).
> [...]
>> According to them, they have been waiting all this time for a shipment of
>> 1040e's from Atari.

I had heard some time back that Atari was trying to discourage mail order shops.
But now I learn that MicroTyme advertises mail order service, and I recently
saw a flier from E.A.Browne Co, advertising STs for sale.

Does this mean that Atari has is a changed its policy?

Or is it still the same, and they are trying to put the mail-order
places out of business, by not shiping to them. I know what you are
thinking now, "Why posit a theory of conspiracy, when a much simpler
theory, such as incompetence or bad luck, will suffice?"

I dont know. The devil made me say it.

You know, I just thought of something... Apple apple hasn't made any
real complaints against the GCR, and we (GCR users) have been thinking that
this is because Apple doesn't consider us a threat. What if they do
and they gave a few of their engineers an ST and said "Try to make
System NOT run on this thing." That way they wouldn't ruffle any feathers
or cause any great legal arguments. I'm using 6.0.3 and I'm not going
to change until the verdict on System 7 comes in.

Just a thought.

>be a lot better than a IIsi for cripes sake!

The only problem with this line of reasoning is that nobody knows for sure when this board will be produced (if at all). With the Mac, and other computers that are currently on the shelves, you get a powerful computer that you can use today. If one were to follow your line of thought, then you would never buy a computer, but always wait for that marginally better one around the corner. Any computer you buy is going to be "obsolete" in a year or two (maybe sooner!) anyway.

>Not only that but the MAC IS LAME for playing games, I don't play games
>often but when I do, my ST is far better than any Mac game program.

Is this really a useful way to judge a computer....by how well it plays games??? C'mon...Nintendo machines are cheap. :-)

>I would RECONSIDER if your a student, like me who is poor and currently
>in the dog house.

Yes, computers are expensive, BUT Apple, Commodore, NeXT, Sun and many other companies offer SUBSTANTIAL discounts to students. Atari does not, Dave Small does not, Jim Allen does not. You should also consider that.

Funny you should ask! Yes, I do have a port of RCS (version 4) for TOS. I recently got permission to release it. The original sources are PD from Purdue, but I felt I had to get permission to release my modified version without an Atari copyright on the changes.

Unfortunately, I haven't had time to put it together in a realease package. In addition, I haven't done rcsmerge, as the process stuff was too hairy for me at the time. I think I'll release what I've got, rather than wait for an improvement that may never come. Keep your eyes peeled.

I have seen mention on the Atari ST RT on GEnie a product for under $100.00
called "Overscan" that will fill in the borders on most STs in all rezolutions.
It's a hardwire mod. and simple for those with soldering experience. There
was mention there of a half dozen more mods, kits, and monitors that provide
enhanced video on the ST. Overscan is a German product I believe.

I wouldn't worry. If Apple System 7 doesn't work on the GCR initially,
(I'd be shocked if it did) I'm confident that Dave Small and company will
shortly follow with an update that will work with System 7.

Would it be an idea if there was a 'starter pack' available on an FTP site
(e.g. Atari.Archive)? This could consist of uudecode / arc / lharc / zoo
etc. and be in the form of a self-unpacking archive. Thus, when this was
downloaded, the 'chicken & egg' situation would be resolved.

If there is any interest, I'll make one up and upload it.

> the larger memory...so why splash out extra dosh for a 1040STE?
>

Can Atari really be so stupid? Can they really? Is it possible that they
want to disable one of the best features of the STE, just to
'differentiate the market'?

Well, I guess most people who've been following this newsgroup for some
time will know that it's possible for Atari to do all sorts of foolish
things.

Still, some are more foolish than others.

Over the past few years I've recommended STs to quite a lot of people in
the University I work at. I'm certainly not going to recommend any
machine which cannot have its memory upgraded quickly and simply. In
the 1990s anything other than plug-in memory simply isn't good enough.

In the UK, Atari have certainly not covered themselves with glory with
respect to the STE's release:

* They failed to get the specifications to developers early enough, with
the result that there was a great outcry about incompatibility when the
STE was released without any fanfare in Autumn 1989

* They have consistently refused to acknowledge that the STE's DMA
interface was, until quite recently, wrongly designed and manufactured.

* Now they're selling STEs without SIMMs.

To be fair, some of this is probably not the fault of the UK people.

Don't get me wrong. I still think my STs (especially my STE) are very
useful machines. I'll still be using them in future. But I think the
best that can be said about Atari the company is that it would make an
excellent case study for management schools, as an example of how not to
innovate and market IT products. This is despite the excellent work
being done by some Atari employees who are doing their best to make up

for the utter crassness of the top management.

I know this is not constructive. I know I'm griping. I know I'm providing what is technically known as 'Chris Mauritz fodder' (Hi, Chris. :-)) But some things are just too exasperating to let go without comment.

WordUp 3.0 is now suported from E.ARTHUR BROWN Phone. No. 612/762-8847
USA. this was from some info on Genie, also there are some Update
Files there from Neocept, Wordup4.arc from what i can remember, about
350k long, i hope this helps, a friend here in NZ. had a copy, but
it would not work on UK type machines, he rang them some time back
and they Stated that is was only for USA machine, but they would
change it, he is still waiting, but the funny thing is he did get
his new Deskjet program a week or so back, it is now 3 months back
since he sent his disks back, and now he does'nt no what to do, he never
made a back up of the disks, the Machine check is easy to fix, i don't
know why the software is set to only work on USA machines, i took out
the check and it worked on UK machines, no problem with the UK key board
so why the lock ???

Yes I have one... The GFA 3.XX Compiler allow you to link GFA modules
& Turbo C modules... The only thing you have to do is use the option line

$X <Fn_name>

Try. Enjoy.

Daniel.

3813. Startgem for STe

Newsgroup: comp.sys.atari.st
Date: 1990-12-06 13:31:06 UTC
From: csual@warwick.ac.uk
Message-ID: <1990Dec6.133106.886@warwick.ac.uk>
Source record: 236651

{ Sorry about posting this, but I lost the guy's e-mail address... }

As you've no doubt guessed, 'startgem' doesn't work on the STe. However, if you single click on the GEM prog you want autobooted, then select "Install Application" from the menu bar, you can click on "Auto" and "GEM", then "Install".
The Disk will buzz into life briefly but I don't know why - I still have to save the desktop to install it properly.
The one drawback is that you can only install one GEM prog as autobooting, but this is usually all you need.
Auto folders still work, and are executed BEFORE the Installed Application, so you can do things like setting up a ramdisk before autobooting Neodesk.
Hope that helps - by the way, are you using TOS 1.6 or 1.62? If you are using 1.6 do you know the Medium Res boot trick? You don't need shellfix.prg - if you edit your desktop.inf with any text editor, there's a line about 6 lines down with about three pairs of hex digits. If you change the last one to 03 then save the file you get instant booting into medium res! (I don't use medium res as I've got a High res monitor, so the details might be a bit inaccurate, but I know it works so if you have any problems, mail me)
Hope this helps, and I hope you like your new STe. Check out the Jungle Demo (awesome scrolling) or the Fantasia demo (Great Music) and be smug with your friends!!!

Jas.

For those in the UK, Lancaster university FTP site has a directory
(p99) in the atari section which contains all the software: eg
arc,lharc,zoo,uudecode,uuencode. It has the code for uudecode in both C
and old atari Basic as a bootstrap to get the actual version of uudecode
to work. More detaisl from them.

Hope this helps

3816. Re: Subject: seeking advice on WordUp 3.0 (Re: printing)

Newsgroup: comp.sys.atari.st
Date: 1990-12-06 14:12:29 UTC
From: rgoseweh@digi.lonestar.org
Message-ID: <1322@digi.lonestar.org>
Source record: 236729

I am using WordUp 3.0 more or less succesfully. The initial versions of 3.0 were VERY bug-ridden. However Neocept had posted "updates" (which were files that had to be re-installed with their install program) on GEnie. There were at least two (possibly three) updates posted. With these updates, my copy rarely has any major problems.

In regards to printing, I am using TurboJet for my HP DeskJet. I had upgraded to the latest version, but the single disk that I recieved with no intructions in a plain business envelope had a corrupted DeskJet driver file. I returned it for a replacement via certified mail, so I know that they have received it. (In the meantime I am using the old version of TurboJet.)

Unfortunately, that was two months ago. I have been unable to contact Neocept since that time. From the returned certification card, they have apparently moved. My local Atari ST dealer just received an invoice from them but it uses the old address. The other part of this problem is that I cannot read the new address on the certification card since the original address had been scratched out and the new one scribbled in by our illustrious mail carriers. If I ever get the upgraded TurboJet, there is a new install file for that on GEnie as well. Neocept apparently did an extremely poor job in testing their products this time around.

One of these days, I will see if I can get WordUp 3.0 to work with my Migraph DeskJest driver. It is a much better quality driver.

Regards,
Roy C. Gosewehr

3817. Neocept

Message-ID: <1990Dec6.142316.7956@rodan.acs.syr.edu>
Source record: 236658

OK...OK...this has gotten out of hand, I think. I've gotten
a couple of notes from people who are having problems with
WordUp and have not been able to contact Neocept. If anyone
knows anything about the status of this company, please post
it to the net. Also, if anybody is still a member of Genie,
Delphi, or Compuserv, could you check if anybody on those
services knows about Neocept's status? and let the net know if
anyone does? For that matter, maybe Neocept is on one of
those services giving vender support?
Thanks very much in advance.

Moshe Braner's IBMFMT (at least, version 1.1 - don't use version 1.0) puts a random serial number in the place the ST expects to find it, so it's OK to use any number of IBMFMT'ed disks in your ST. As a general prescription, though, Lee Dickey is quite right to warn about IBM-formatted disks. The serial number problem will hit you just when you least expect it, and unless you know what's happening it can be very nasty. If in doubt, stick to one IBM-formatted disk.

I agree completely. At no time in the past have I insulted anyone, used
foul language or showered anyone with personal abuse, yet I see these
"Cheerleaders" resorting to those kind of arguments all the time. If
you have anything of worth to say, say it. Personal attacks only make
you look foolish.

I personal wouldn't buy a MAC either. I am not a student so I wouldn't be able to get the student discount. Plain and simple I can't afford a MAC even if I wanted to buy one. My ST still delievers me more bang for the buck than a MAC with the software that I can buy at VERY reasonable prices. There are a lot of people around that can't afford to go out and spend $3000 on a new computer. For you that can, great, go do it, but PLEASE stop belly aching on the net. It is getting a little old.

Just my two cents...

Keith

>
>That makes two of us... [stuff deleted]
Well, five, that I know of personally.

>I am wondering if there is a person who is using WORDUP successfully.
I'm wondering if there is anyone who bought WordUp or TurboJet in the past
12 months who is using it successfully with an HP printer. (CAVEAT: It's
not the printer's fault. Guess who I work for? :-)

>I am wondering if someone know where Neocept is.
I read a rumor here that they were going under. They're definitely not
answering calls or responding to mail. They did cash my check, however.

>I am wondering if they will ever rewrite the sucker.
>I hate to say I made a bad decision.
If they truly *are* going out of business, then the suckers is us. I, too,
hate to say I made a bad decision (see my postings about Neocept and
TurboJet). I also hate to think that I may have steered some people wrong by
recommending TurboJet in the first place.

>Rather I hate getting robbed!
Ditto. And if the really are "going under", then they will file for
bankruptcy and we will never get *ANY* satisfaction.

>
> Jong-Woon Kim

TO REPEAT: Don't buy TurboJet from Neocept, unless you already have WordUp.
Better yet, don't buy WordUp!

If you need GDOS drivers for your HP printer, the only place I know of that sells them is Migraph. Here's the info about Migraph:

Migraph, Inc.
200 South 333rd Street
Suite 220
Federal Way, WA 98003

phone: (206)838-4677
fax: (206)838-4702

GDOS PRINTER DRIVERS AVAILABLE FROM MIGRAPH:
Includes suggested retail price. You can get them for less than this.

Canon PJ-1080A & compatibles color $24.95
JX80 & compatibles driver $34.95
Okidata color (incl B&W drivers too) $49.95
C.Itoh Prowriter & compatibles $19.95
Fujitsu $29.95
Epson LQ (360x360 dpi, you need 1MB $34.95
printer memory, limited font
sizes included)
Epson LQ (180x180 dpi) $24.95
Epson LQ combo (both of the above, $49.95
remember the extra 1MB)
Okidata B&W driver $34.95
Toshiba (180x180 dpi) $24.95
HP DeskJet (you need 1 MB printer $49.95
memory)
HP LaserJet Plus and Series II (you $49.95
need 1 MB printer memory)
HP 747x & 7550 plotters, HPGL devices $49.95
(vector graphics) & IBM 7372
Houston Instruments plotter, DMPL $49.95
compatibles
Roland plotters DXY 880, 885, 980, 985 $49.95

I can personally endorse the DeskJet driver and the HPGL plotter driver. We have used both at HP. In fact, I've used the DeskJet driver in 150x150 dpi mode and the output looked great -- even the 8-point and 6-point (?) fonts. You only need the extra printer memory if you're going to be doing full-page 300dpi output.

I wish I'd bought the Migraph stuff instead of the Neocept stuff. It seems like a case of having been penny-wise and pound-foolish.

FIREPROOF DISCLAIMER: The above prices are for reference only. Prices may change before you get around to buying them. Prices are based on direct-mail order from Migraph. Add tax & shipping where applicable. This posting does not constitute an endorsement by Hewlett-Packard of Migraph's products (or anyone else's). The author is not connected in any way with Migraph or or Neocept. Or Atari. This is not an advertisement, merely an attempt to help some people make their brain-dead GDOS applications useful. Refrigerate

after opening. Do not overtighten. Contents may settle during shipment. Not responsible for damages, direct or consequential, associated with usage contrary to the instructions printed on this package. Slippery when wet or Neocept.

Hello all,

Time to crank up the rumor mill. Practical Solutions is having a mail-order sale, for User's Group members only, of their Atari ST hardware -- items like Tweety Board, VideoKey, Monitor Master (my favorite!) and other goodies.

Does this mean:
a) they're going out of business?
b) they're getting out of the Atari business?
c) they're way overstocked with obsolete stuff?
d) they're just way overstocked?
c) other? (fill in the blanks) _____
_____
_____

Just curious.

~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
Well if Apple did that they would make a lot of Mac users pissed as hell.
Remember the Mac is generic hardware that's why you can run their software
on a ST or Amiga. The code will be binary compatible no matter what,
because the CPUs are in the same family. No matter what they do short
of redesigning the Mac will stop ST and Amigas from running Mac software.
If they redesign see the above problem about pissing folks off.

Like I said generic 68k hardware, nothing really special except the OS.

Date: 1990-12-06 17:16:04 UTC
From: mjs@hpfcso.HP.COM
Message-ID: <7340048@hpfcso.HP.COM>
Source record: 236741

Followup: my two problems turned out to be software related.

Forthmacs was unable to write my file to disk because the disk did indeed fill up. I have no idea where the space went; I deleted a file that should have been 150K, but only have 74K left. Perhaps the file wasn't really that big, or the disk had a bad spot, or TOS lost a few blocks (the latter possibility may be worth worrying about, but it hasn't happened again).

The lockup when my MIDI instrument was on appears to have related to one of the public domain desktop accessories my dealer had installed (a calculator and a ram buffer) or perhaps the HAL9000 program he put in my auto folder. I blew them all away, and now it works fine.

I still am annoyed about the warranty (although it was only 90 days to begin with), and I still wonder what this "Rainbow TOS" is, but I am a lot happier than I was yesterday.

>1040ST used to create snow on any TV I was watching in the same room.
>Of course, matters didn't get much better when I removed the RF shielding
>to make room for my RAM expansion board. :-)

I can add a few things here. I have an old 1040st, and a few peripherals for it (SCSI disk, printer, modem). I also have an AT&T 6300, a rather doddering PC-clone machine; it has an internal 30 meg drive.

I am particularly concious of RFI [radio frequency interference] because, as a radio amateur I am constantly running both radios and computers in close proximity. For those who are interested, the application is amateur packet radio networking, a very interesting mix of two technical hobbies :-). But I digress.

In short, the 1040st howls all up and down the bands. We're talking continuous S9+20dB heterodynes and growlies from baseband all the way up to 450 MHz (to be charitable, it does fall off somewhat in the UHF bands. On 145.01 MHz it's still pretty damned loud). How this thing ever got past the FCC I can't begin to imagine. I can only assume Part 15 subpart J class B means "leaks RF like a sieve". It took fairly heroic measures to get the intereference down to the point where I could recieve anything from other stations; lots of bypassing, coax cables, chokes, shielding, and physical separation were needed. Having done all that it works fine (good serial I/O, lotsa horsepower :-).

Now in contrast, the pc6300 is _silent_. A little rumble on 75 metres perhaps, but otherwise dead quiet straight out of the box. A nice steel chassis, bolted together quite thoroughly; chokes on all cables running in or out. Of course it's an 8086 abomination but at least it isn't destroying all reception in a 30 metre radius! And it's only certified to class B. Most strange.

The thing that really puts the cap on this, however, is the ds2100 that I am pounding this note in via. 16MHz risc box (mips engine), 12 Megs of ram, a whole raft of externally cabled SCSI devices, ethernet connections, a mouse, a 1000 x 900 display, oceans of transistors all frantically switching, right? And it has a class A certification, which is even more relaxed than the class B of machines intended for

home use.

And yet, and yet, it's almost as quiet on 2 metres (~ 146 MHz) as the pc6300. What exactly is Atari doing wrong, and why are their machines so noisy? Corner-shaving and cost cutting have limits, y'know.

Yours for RF sanity,
--

Yes, however, Atari does not need to offer Substantial discounts because their equipment is low price already. And besides, almost NOBODY would by a mac without those discounts. By your logic, you should by the computer with the biggest discount on it... If so, I've got this old 8bit for 75% off (because you are a student of course).

Also consider that an STe with the third-party hardware being discussed
will probably come in below even Apple's discounted prices. (Commodore's
& NeXT's educational discounts do seem pretty deep, though.)

Me, I need to buy another car before I can contemplate another computer...

3830. Microsoft Mouse

Newsgroup: comp.sys.atari.st
Date: 1990-12-06 19:25:22 UTC
From: jon@DARTH.CC.MCGILL.CA
Message-ID: <9012061925.AA27307@.darth.CC.McGill.CA.>
Source record: 236745

I've been following the thread on the Microsoft Mouse with some interest as my fourth Atari mouse in five years is about ready to bite the dust. I've got a Mega and the MS Mouse fits fine in the mouse port but I get no response from the mouse at all-- it works on an IBM.

I thought I read awhile back that someone managed to do this-- or am I dreaming? Are there any wires to be crossed or some such thing?

I should add that I recently tried plugging the Microsoft Mouse in and *nothing* no response from the ST whatsoever.

Jonathan

3831. Re: If you insult Atari employees they'll just leave

Newsgroup: comp.sys.atari.st
Date: 1990-12-06 20:06:18 UTC
From: saj@chinet.chi.il.us
Message-ID: <1990Dec06.200618.16990@chinet.chi.il.us>
Source record: 236746

As long as certain specific inflammatory topics are avoided, I've found Bob Retelle's postings to be useful contributions to the Atari groups. Maybe he got a little shrill just this once, but what's that among friends.

All the Atari people, including John Townsend, are very helpful to this group. I just wish they'd post a bit more. For that matter, there have been some extremely welcome postings from Commodore and Apple employees.

Anyway, the more rounds of flaming that go on in public, the longer the anger lasts. Can we make nice in public and take the hostility to email?

And very much to the point here: there should be no question of non-public information in answering these questions (from Atari, please):
1) Have the TT and the Mega E received any FCC certifications (if so, what?)
2) Are any pending certifications on them awaiting FCC action as next step?

Steve J.

3832. Low-rez autoboot

Newsgroup: comp.sys.atari.st

Thanks to everyone who replied to our first post. As some of you pointed out, it would be more helpful if we said when and where we would be.

Our schedule is now set, and here it is:

Jan 2-7 - London - Staying at Grovener Victoria
Jan 7-9 - Amsterdam - Staying at Pulitzer
Jan 9-12 - Paris - Staying at Elysees Poncieux
Jan 12-14 - Eurail pass - we don't know where we will be staying, but we are planning on going up to Germany, perhaps Frankfurt and/or Langen.

We would like some information about places to stay once in Germany, since this is the only part of the trip not booked in advance.

We would also like to meet as many of the NET personalities as possible. If you are within reach, let us know. (We'd love a native tour guide! <grin>)

We will be at the London 16bit Computer Faire on Jan 4-6, and have a couple of FREE one day passes, good for Friday Jan 4 only. Contact us for them.

We are in stand 38 at the show. Come on by!

Looking forward to hearing from some of y'all. We would definitely look forward to meeting with a club, or a group of individuals who have STs!

- mike

Well, you can get a NeXTStation with:
Megapixel 4-grayshade monitor, 17 inch, about 1200x850 pixels
8MB RAM, 105MB HD, 68040, DSP, ethernet, SCSI II, etc. etc.
Lots of good software.

For about $3200 educational in most universities in the U.S.

An additional HD is recommended, though.

If TT's educ. price would be about $3000 (highly possible), I could see
no reason to get one over the NeXTStation (I wouldn't get Amiga3000UX either).
So that's why I will get a NeXTStation. I now have an ST and I have had
it for about 5 years... But I don't have to stick with Atari anymore.

3838. ST Stuff, reprise

Newsgroup: comp.sys.atari.st
Date: 1990-12-07 04:18:44 UTC
From: lbert359@pallas.athenanet.com
Message-ID: <459@pallas.athenanet.com>
Source record: 236654
Cross-posted to: misc.forsale,comp.sys.atari.st

After a day responding to lots (and lots) of e-mail, I must admit
that I in no way anticipated the response to my original posting
regarding ST items for sale. My thanks to everyone, and I am sorry
that there was not enough of the good stuff to go around.

In any event, here is what is left of the carnage, for those of
you who might still be interested.

Hardware: (all used except for the mice, Drive B, and Z-times)
(price for each)
Atari SF354 diskette drives: $35 (3) These are single sided drives
Navarone flatbed scanner: $500
Atari 520ST: $150

Software: (all in original shrinkwrap except as noted, price for each)
Timeworks Wordwriter/ST $25 (1)

Red Alert $3 (1)
A-calc $5 (1, open)
Flash $3 (1)
Macro Mouse $3 (3)

MaxPak $3 (2)

Chat $2 (1)

Issues of Start, brand new, at least two of each, *with* disk, $1 each:
1987 - Winter, Summer, Fall
1988 - Spring, Summer, Specials #3 & #4, Oct, Nov, Dec
1989 - Jan - Dec

I also came across two Data Pacific Translators. I'll $15 each for these.

Well, I don't think this is really true. Just the fact that you've written these notes prove you wrong. If you guys are so sparkling clean, why did you find it necessary to generalize about Atari employees, and happy Atari users by saying that they always resort to personal attacks when that can't think of any facts. Seems to me that you guys are getting a little personal here. I have seen useful information come from both Bob and Chris. I wish they would tone down their criticism a little, but normally there is at least some merit to their criticism. I don't think that people should be talking about preventing them from writing notes at all. It has been said before, and I'll say it again. If you don't like what Chris and Bob are writing, either set up a kill file, or

just don't read their notes. I knew Allan Pratt when he lived here in Bloomington. If he could put up with me, and Cat, I'm sure that he can ignore the complaints that he sees here. It would be nice if people would thank him, and John, and the other Atari employees more often. They are spending their own time to respond to notes. I wish that Atari would do a lot of things differently, but they are a small company. They have a plan, whether it's apparent to you, me, Bob, Chris, or even Allan. They've been very sucessful in Europe. I'm co-oping with IBM right now, and I guarantee you that IBM displays many of the same faults that Atari does. Promises about software that never materializes. Trust me, Atari does not have a monopoly on missed opportunities. If a company as large as IBM can piss off customers, I don't see why people should try to judge Atari any differently. I got to see the SHARE songbook a couple of weeks ago. What is the SHARE songbook? Well, SHARE is a national IBM users group. Their songbook is a very large collection of songs written by IBM customers about IBM hardware and software. I skimmed through a small portion of the songs (maybe 20 or so), and all of them were very derogatory.

Gosh, this turned out to be longer than what I had originally intended. I'll summarize by saying that I'd much prefer an open discussion that included negative views, as well as positive views to a closed discussion that policed each note that was written.

And lastly, I'd like to thank Allan Pratt, John Townsend, and the other Atari employees that take the time to read, and respond in this forum. It may not always be apparent, but your efforts are greatly appreciated.

3841. limited support for WordUp

Newsgroup: comp.sys.atari.st
Date: 1990-12-07 10:51:28 UTC
From: davidli@simvax.labmed.umn.edu
Message-ID: <1990Dec7.105128.1@simvax.labmed.umn.edu>
Source record: 236676

I just got done talking with E. Arthur Brown on the phone, and wanted to let those who are considering WordUp (or who already have the program) know what's apparently going on...

E. Arthur Brown Company is providing LIMITED support for WordUp. They sell the product in their current catalog, and have become the 'unofficial' source for support when it comes to replacing disks and/or looking at simple problems. (Examples of simple problems - determining whether you're using the wrong version of TurboJet, or when you don't have enough memory.) They are not equipped with the means to provide bug-fixes beyond those already fixed by Neocept. They don't have the source code, nor has Neocept sold the rights to WordUp to anyone.

If one of your release disks does not work, they will replace it for a small fee (about $5, but call for the correct price). There have been updates to disks 1 and 5 since WordUp 3.0 came out. You can update all 5 disks for about $14. Updates/replacements require you send in your original disks.

It looks as though Neocept is out of business, so if you're having small problems, or need disk replacements, you should contact E. Arthur Brown Company. If you haven't received their catalog before, you should *definitely* ask to have one sent to you.

E. Arthur Brown Company
3494 Pawnee Drive
Alexandria, MN 56308

(612) 762-8847

[Posted as clarifying information only. I am not connected with E. Arthur Brown Company, nor have I purchased anything from them, but I will be sending in my WordUp disks to be updated, and I do live in the same great state :-)]

I think this won't do what you want it to do for you. Use RESERVE 10000
instead which gives you 10k for your GFA program (including variables)
and gives back the rest of the memory to the system. However, I'm no
GFA expert and might be wrong on that one.

>adress = EXEC (3,"A:\PROG.PRG") ! loads program in memory, returns basepage-adress
Uh, someone around with a Pexec cookbook handy? Can't remember what mode 3
does.

>start = LONG {adress+8} ! Starting adress of program
>dummy = C:start() ! Execute C program
>END

I would recommend you to use Pexec mode 0 (load and execute) instead of
executing the program yourself. So change the 3 to a 0, and delete the
rest of the code.

This, however, is still not the best way to do what you want. Instead,
you should compile your C module to an DR-compatible object file.
I think GFA has a real linker since V3.0 or something which will
allow you to link C and GFABASIC modules to form a hybrid program.
The compiler manual will tell you more about that. This way, you can
handle the C module as if it's a normal subroutine, pass parameters...

Last, but not least: Compiled GFA code is reasonably fast; in most
cases, there's no reason to use C subroutines. C code is not
necessarily faster - but always cleaner! If you want it real
fast, do it in assembler.

>My questions are :
>1. What the hell am I doing wrong
See above.

>2. What do the terms in the basepage mean ? (TPA, TEXT etc.)
TPA means 'transient program area' which denotes the memory GEMDOS
assigns to your program when starting it. TEXT means 'text section',
i.e. the code proper. DATA stands for 'initialized variables'
BSS for 'block-storage section', i.e. unitialized variables. The
Pexec cookbook will tell you more about it.

>

Well, yeah. You guys have pretty much state the reality.
Atari has been aiming at cheap computing and that's your answer.

They leave the stuff as marginal as they can get away with
for RFI because anything you do about RFI costs money.
But taking it from the top, the problem starts with IO interfacing.
You can build a dirt cheap computer with no IO. A grounded cage
does it. But as soon as you start adding IO ports you've got
troubles. The Atari ST is rich with IO ports, and not all
of the best possible quality. You've got the 2 MIDI ports (the
basic spec of which looks noisy I might add -- not Atari's fault),
an RS-232C, semi-SCSI, Centronics, 2 joystick and cartridge port.
Take that "Centronics" port. The original Centronics used every
other wire as a balance which could have helped cancelled "some"
RFI (doesn't help that much anyway really). But the Atari doesn't
do anything with them. Actually, I'd be happier them connected
for data reception like the Amiga. But the only way to silence
that one is a *very* expensive fully shielded cable. The cartridge
port should be given a bolt on metal "protector" when its not
in use. If it was a Japanese company, maybe a hinged door would
have been included. Also, I'm not sure what the keyboard looks
like if you take that apart. I have a feeling you'll find it
an excellent source of interesting radio signals. :-)

In passing, the most impressive *looking* computer I've seen
RFI-wise was the TI-99/4a. I took this apart and it looked just
beautiful! All this nifty shielding all over the place. . . .

It looked almost Mil Spec. I have no real idea about how effective the shielding was, but it certainly looked nice. Another matter about the basic PC boxes is that nobody has to research them anymore. A lot is known about them. You just have to look at a "good" example and copy it. Be that as it may, a lot of IBM related stuff has failed FCC over the years. Not surprisingly, from what I gather, a lot of it was IO stuff.

I would rather we didn't insult the Atari employees who write here in case they feel that they would rather stop writing. I appreciate the technical help and occasional scoop on company policies they sometimes post and would be very sad if they were to stop. Those employees are not the policy makers but the programmers and engineers and as such should not really take such flak. At best we can hope that any of our more reasonable gripes are passed on to higher powers within the company and result in change. (eg. TOS 1.4 UK distribution)

So Bob, in the interest of keeping in with the company that makes my favourite computer please "stop yer bitchin'".

3849. Re: Neocept--E.Arthur Brown.

Newsgroup: comp.sys.atari.st
Date: 1990-12-07 15:26:03 UTC
From: rgoseweh@digi.lonestar.org
Message-ID: <1330@digi.lonestar.org>
Source record: 236690

Regarding the note (on GEnie) stating the E. Arthur Brown is supporting WordUp:

I have not seen the note on GEnie (and it may well be true) BUT -

I have received the latest catalog from EABCO. In it they state that they are selling (cheap) copies of WordUp 3.0 with a 30 day warranty because THERE IS NO SUPPORT. They specifically state that they realize that there is no support from Neocept and that EABCO cannot support this program. Hence they will give you 30 days to decide if it works for you. If not, you can return it for a full refund.

Now it is possible that things have changed since the printing of the catalog but I think it is more likely that the original posting was misinterpreted or misunderstood. So please don't demand support when calling EABCO. They are a good company (I have ordered from them in the past) and would not like to see them take any heat from possible misinformation posted to the net.

In article <479@aupair.cs.athabascau.ca> rwa@cs.athabascau.ca
(Ross Alexander) writes and interesting and informative article
about Radio Frequency Interference (RFI) and his early Atari 1040 ST.

He says, in part,

>I can add a few things here. I have an old 1040st, [...]
>...
>I am particularly concious of RFI [radio frequency interference]
>because, as a radio amateur I am constantly running both radios and
>computers in close proximity.

and further on, he says:

> [...] How this thing ever got past the FCC I can't begin to imagine.

It just might be that his machine did not have FCC approval.

I dont know where Ross bought his machine, but I notice that his
address, (like mine) is Canadian. I always assumed that my machine
did not have FCC approval at the time I bought it.

So, I ask you, users who bought outside USA,

does your machine have an FCC label on it?

If you bought your machine outside the USA, does it have on it
any sticker or label on it that says FCC approved, or the like?
Such a label might make reference to subsection J, class B
computing device.

Every body how talks about the Next being so CHEAP (I mean cheap, not inexpensive)
are forgetting that the Stations cannot be ungraded to colour,
Software is outrageously expensive (>$500 for the cheapest),
The 360 meg hard disk increases the cost by $1500 CANADIAN,
etc....

Not to mention that the NeXT system is slow. Its the old Apple system
problem plus Postscript display slowdown. Just talk a look at their
flight simulator.

Sorry, I just had to say that.

>Lots of good software.
>
>For about $3200 educational in most universities in the U.S.

I believe the educational price for the NeXT laser printer is
~$1000-1500 (I lost the price sheet). So maybe my original posting
was a few hundred dollars high, but I suspect $4500 for a system as
noted above plus the 400dpi laser is pretty close.

What are Atari laser printers selling for these days? I haven't
seen one in ages, though I have seen the toner cartridges for sale.
Did Atari ever come up with a workable way to print postscript
files on it?

>An additional HD is recommended, though.

Yep, 100 megs is on the skimpy side for a unix box. I would think
you'd need more like 300 megs to have a nice liveable environment.

>If TT's educ. price would be about $3000 (highly possible), I could see

As far as I know, there is NO educational discount program at Atari.

>Having done all that it works fine (good serial I/O, lotsa horsepower
>:-).

This is my first posting in this group in many moons, since I'm a
discouraged Atari owner now using a clone for packet radio among other
things...

But I don't understand the problem. The _nicest_ thing I can say about
my 1040STe is that it is _quiet_ (at rf). My no-name clone, and its el
cheapo monitor, make moderately annoying noise on some of the HF bands,
and a little (S1 but enough to clobber weak-signal on 2m, not packet)
on 2 meters. The 1040St, on the other hand, makes very little noise.
If my wife is using it in the next room, I don't know it.

Note that I _never_ breached its internal shielding to, say, add memory
or an 8530 or TOS1.4 or anything else. It's still factory-soldered.
And there's no HD, just the build-in sloppy disk, and the Atari color
monitor. If it could do HDLC (darn, no bus!) it would be a great packet
computer. I'd check the internal shield integrity.

3859. Re: Data Base Mangers

Newsgroup: comp.sys.atari.st
Date: 1990-12-07 18:51:39 UTC
From: andyc@hplsla.HP.COM
Message-ID: <5440136@hplsla.HP.COM>
Source record: 236662

wao@cbnewsm.att.com (william.a.oswald) writes:
|
| I'm thinking of buying a database manager but the topic of what is
| good and not so good has not come up recently. So, any body have any
| recommendations? How good is DBman, is it worth the money? By the
| way, my needs range from simple to complex and I would rather
| invest in a piece of software that I won't out grow.
| ----------

I started out using Base Two for some simplistic needs and quickly outgrew it. I think it has a major limitation in that the only way to input data is manually. It doesn't import any format of file (not even ASCII).

I switched to SuperBase Personal because of its numerous import/export options, which includes the DIF format (which Base Two thankfully exports) and Lotus 123 spreadsheets. Now that I've had it a few months, I'm not sure whether I would buy it again or not. Whereas it does import all these wonderful files, error checking is VERY POOR and the results are not 100%. Here are some examples:

o import a DIF file with a record >256 chars and the import aborts with a generic error message - no clue as to the problem

o import a LDW Power worksheet file before converting to Lotus format and the program bombs

o dates are not properly imported from Lotus 123 files

o converted LDW Power files are not properly imported; I have to load them into Lotus and re-save them before they'll import correctly

Okay, so importation can be a hassle. Another hassle IMHO is that the program does not use the GEM file selector. The program has its own built-in extremely crude file selector dialogues that are probably slick on a DOS machine but very crude on the ST.

These issues aside, I find the program to be reasonable to use and it looks tough to outgrow it (and I guess an upgrade to SuperBase Professional would solve that). And since the program exists on the Amiga and DOS machines and supposedly imports/exports dBase files, I feel reasonably confident that my databases can be ported to my next machine (whatever it is).

Disclaimer: These are the opinions solely of the author, who has no pecuniary affiliation with the companies that sell the programs discussed.

>>it for about 5 years... But I don't have to stick with Atari anymore.
>
>Yep, for a unix box, the NeXT will be tough to beat at this price.

But then again, the NeXT isn't much of a Unix box. The Unix consultants
I work with are quick to point that the NeXT "just happens to run Unix"
instead of being designed as a Unix box. If you've used a Sun Sparcstation
or a DECStation, you'll know what I mean. They don't cost _that_ much
more than a NeXT.

Message-ID: <5051@trantor.harris-atd.com>
Source record: 236700

As a followup to WordUp 3.0 problems... I finally got mine to print on an Epson printer. Once I got that working, I was pretty happy with the tool (except, of course, for Neocept's non-existent support). Now I've run into an apparent bug where blocks of text misteriously vanish. Anyone else seen this happen?

3863. Re: RFI, the FCC, and STs (was re: Talking about other computers here)

Newsgroup: comp.sys.atari.st
Date: 1990-12-07 22:16:39 UTC
From: dclemans@mentor.com
Message-ID: <1990Dec7.221639.11311@mentor.com>
Source record: 236664

For the record, the two ST systems I have are both relatively quiet in a RFI sense; while I've never specifically checked, I've never noticed any interference on nearby TV's, radio's, etc.

I heard the following from someone who visited Atari headquarters in California... (i.e. this is all hearsay)

As far as RFI containment is concerned, they design their systems to match the minimal requirements of the country where it's first introduced; typically Germany. To ship product anywhere where standards are stricter they have to "patch" the design.

However, I've heard that Germany is going to change its RFI standards soon so that they are greater than or equal to US requirements, so the above problem might go away soon.

The first and foremost requirement on manufacturing is keeping the cost down. If you get lucky things will be fine. If there is a run of "marginal" parts, boards, etc. there could be noise problems, reliability problems, etc.

Staffing was described as being lower than you would expect in a one product startup company. They basically can only work on one product at once; to get different products out they have to work on them in series. If a particular product never gets enough priority to reach the top of the queue, it never gets finished.

Hello, I just ordered a Supercharger IBM emulator box for my ST and I would like to hear from anyone who has any experience with this little device. Any hints and/or tips would be greatly appreciated.

Also, I am new to the network and I don't know much about doing anything, I am lucky to be typing this :-] I need a bit of help to learn how to get files, know my address on here, go to different sections, etc... I know almost NOTHING! :(I have a 1040stfm, color & mono monitors, and alas, no hard drive (yet!). An example of what I want to do and what I can do is: I want to be able to get files, ST-World, Z-net, etc.. but the only thing I can do is read messages in the comp.sys.atari.st and comp.sys.atari.st.tech newsgroups. Can some kind soul(s) please fill me in on some details. I am very glad to be able to find ST info, this is quite nice. Thank you in advance.

In defense of Atari... (what a concept..! better sit down folks...)

Atari never stated that the STe was expandable... in fact, Allen Pratt tried to warn people about just this very possibility. Atari puts in whateve parts are cheaper that week, SIPPs or SIMMs, without any concern about whether or not the end user will be able to expand the machine.

Charles Cherry, when he was at Atari, said that the TT is officially the *FIRST* Atari product to be expandable.

So with the STe, you pays your money and you takes your chances...

This is terribly bad news...I like WordUp, and I still think
it is the word processor for the ST that is most like a Mac
wordprocessor (and that is good!). V3.0 was much better than
the previous version I had, but I was hoping that there would
be still more upgrades...too bad Neocept went under---did
they? I mean are they REALLY out of business, or does it just
"look like" they're out of business (perhaps to return?)?
Oh well, maybe the new GDOS will bring around another new
wordprocessor that can handle various fonts!

3872. TT desktop on ROMS?

Newsgroup: comp.sys.atari.st
Date: 1990-12-08 06:35:46 UTC
From: johns@maccs.dcss.mcmaster.ca
Message-ID: <276089C2.18110@maccs.dcss.mcmaster.ca>
Source record: 236681

I've got the Quarter 4 1990 issue of ST World in front of me.
There is a review of the new desktop that was designed for the TT and
possibly for the STE. At the end of the article they mention something
about getting the new desktop on ROMS. I'm hoping this isn't wishfull
thinking, but does anyone at Atari know anything about that? And, when
the magazine articlsays desktop, do they mean the whole ROMS? I'm
thinking rather than getting the 1.4 ROMS, go for the new ones. Any
chance of that happening?

Message-ID: <1990Dec08.073353.25503@ecst.csuchico.edu>
Source record: 236683

jimomura@lsuc.on.ca (Jim Omura) writes:

- They leave the stuff as marginal as they can get away with
- for RFI because anything you do about RFI costs money.
-
- But taking it from the top, the problem starts with IO interfacing.
- You can build a dirt cheap computer with no IO. A grounded cage
- does it. But as soon as you start adding IO ports you've got
- troubles. The Atari ST is rich with IO ports, and not all
- of the best possible quality. You've got the 2 MIDI ports (the
- basic spec of which looks noisy I might add -- not Atari's fault),
- an RS-232C, semi-SCSI, Centronics, 2 joystick and cartridge port.
- Take that "Centronics" port. The original Centronics used every
- other wire as a balance which could have helped cancelled "some"
- RFI (doesn't help that much anyway really).

And I bet the TT with all its ports causes lots more problems.

Neocept have gone belly up, WordUp is now handled by E.ARTHUR BROWN Co.
Phone No. 612/762-8847, they also offer WordUp 3 for $49,95 US, also
Note: this Program only works on USA machines, it is posible to patch it
to work with other machines, this i have done for a UK. machine, if
there are a few intrested i will give the Patch info so it will work on
other machines, Note: some functions read the Key Codes and not the Key
Table, this is easy to Fix, just Update the Resource File with the New
Key Tops...

Hey there. The ST version of the Kermit software really sucks.
That's coming from someone from the home of Kermit, Columbia
University. You'll be MUCH happier if you use UniTerm 2.0e.
It is a far better implementation and much easier to
deal with. You can probably find this program at your nearest
anon FTP site. It is freeware.

Cheers,

Chris

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I'm sure, that every multisync monitor can work with ST.
I have the NEC 3D, and I see no reason why xD (x>3) wouldn't work.
About 2A, I have a cable to connect ST to NEC 2A, I don't need it.
It is made by LINDY, I have bought it from Germany. But it is quite
easy to make a cable for a monitor, IF you have the pin assignments
(can be found from manuals), IF you can get the proper connectors
(ST's 13-pin round is a problem, cut from old cable).

Why don't you try the Cubase? It is a Great MIDI software package from
Steinberg, propably the best available for Atari.
It uses GDOS and has a driver for Laserjet.

Accelerator? There are HyperCache 016 and HyperCache 030, first one fits
to Stacy I think (Turbo 16 and Jato fits also), second one uses the
68030 33 Mhz and is very expensive, and I think quite big too!

You surely know that ST can read a 3.5" DD floppies written by MS-DOS?
If that disk contains a patchloader program for those files and those
files are in a custom format, only saviour is to contact a sound-library
keeper that offers souds on a patch-loader floppies. But if those sound
files are standard MIDI-files containing pure systemexclusive data,
try to punch them to your module using a sequencer program.

system@n6vbg.hamavnet.com (Javier Henderson) writes:

- I just received the files PLAYER.LZH and BART.SND from the atari
- archive site via mail.
-
- I decompressed PLAYER.LZH, which created PLAYER.TTP, and tried to
- play the sound file. However...all I get is some vertical bars on
- the screen, no sound comes from the speaker, or anything else.

PLAYER is for playing Amiga Noisetracker modules on your ST.
(STEPLAY is for playing NT modules on your STe in stereo.) You need
another digitized sound player from atari.archive. I can't remember
what's on there so I can't offer any suggestions. Anything should be
fine.

- you think of it?

I've seen a couple issues at a local bookstore. My local dealer doesn't have it though, which is surprising. It's glossy inside and out. Pretty thick. I don't remember seeing that many reviews in it. I did see a lot of nice ads that I didn't see in STart or ST Informer. What I also did see was a lot of commentary from big names in the ST world. The strange thing is that these commentaries are reprinted in ZNET almost every issue. So, instead of reading them in a glossy, I can read them on my ST. Since ST Journal comes out quarterly and ZNET weekly, I think ZNET reprints most if not all of them before the next ST Journal is out.

Actually, I heard there were a couple reasons for why there was
soldered RAM in your STs. Neither of these had to do with the 520ST
problem. First, Atari wanted to get these puppies out as quickly as
possible, if they had to use soldered in DRAMs, fine. This may not have
been a great move, but Atari got the computers out more quickly. And you
cannot honestly say that you wouldn't have griped if the first STEs were
delayed more. Second, at least for our European friend, I heard that
there was some sort of a lack of SIMMs over in Europe. I am not positive
of this and maybe someone can back me up or tell me I am wrong.
Besides, I thought that while the SIMMs upgradeability was a good
feature, the stereo sound and graphics palette of 4096 colors were the
two most major enhancements. My friend just received his STE and the
sound was incredible. Anyway, now you can make your questions, comments,
or cheap shots.

3889. Current store prices for Atari Computers!

Newsgroup: comp.sys.atari.st
Date: 1990-12-08 21:22:38 UTC
From: chuck@umbc5.umbc.edu
Message-ID: <4642@umbc3.UMBC.EDU>
Source record: 236699

I just got Toad Computers new price list and thought that I would post some of the interesting products and prices. This is not meant to be an advertisement, but rather an example of current market prices for Atari products.

ITEM CONFIG PRICE

TT030 2mb RAM, 50mb HD $2299
4mb RAM, 50mb HD $2499
8mb RAM, 80mb HD $2999

STe 1mb RAM $549
2mb RAM $749
4mb RAM $849

STacy 1mb RAM, 20mb HD $1539
2mb RAM, 40mb HD $1899
4mb RAM, 40mb HD $2449

Mega ST 2 CPU $899
ST 4 CPU $1249
ST 2 4mb CPU $1099

520STFM 512k CPU $379
1mb CPU $499
2mb CPU $599
4mb CPU $899

Accessories SC1224 Color monitor $319
SM124 Mono monitor $159
SC1435 Stereo Color monitor $339
PTC1426 TT Color monitor $479
SLM605 Laser Printer $1099
SX212 Modem $49
SF314 DS/DD Drive $169
Tilt Monitor stand $19

Also, Atari Computers come with a 90 warrantee, but they are offering a one year warrantee for $49 more.

Again, I am posting this for information purposes only and is not to be considered an advertisement. I do not work for them and can only be considered a happy customer.

Chuck Rickard
(chuck@umbc5.umbc.edu)

3890. Re: Current store prices for Atari Computers!

Message-ID: <1990Dec09.020126.29882@ecst.csuchico.edu>
Source record: 236601

chuck@umbc5.umbc.edu writes:

- I just got Toad Computers new price list and thought that I would
- post some of the interesting products and prices. This is not meant
- to be an advertisement, but rather an example of current market
- prices for Atari products.

(Not) to be picky, but it wasn't required of you to post whose price list it was, although the information is quite intriguing. I'm afraid people may opt not to buy from their local dealer (if they have one). I know people who read this net are more intelligent than call to Toad on Monday and order a spanking new TT; I'm afraid to read in a month (or two or three) that they haven't received it yet and blame it on Toad when the only ones they have to blame is themselves.

- TT030 2mb RAM, 50mb HD $2299
- 4mb RAM, 50mb HD $2499
- 8mb RAM, 80mb HD $2999

Now, we all know these are all sitting in a warehouse somewhere waiting to be branded with the FCC's "seal of approval." Mmm, mmm, $2299 sounds REAL good though.

- STe 1mb RAM $549
- 2mb RAM $749
- 4mb RAM $849

I wonder if these are factory-installed or dealer-installed memory configurations. I wonder where they get the two $35 SIMMs for $200 -- must be a special deal. I can understand if Atari installs them though.

- Accessories SC1224 Color monitor $319
- SC1435 Stereo Color monitor $339
- PTC1426 TT Color monitor $479
- SLM605 Laser Printer $1099

Again, I wonder if the last three are available. I suppose Toad has a lot of SC1224s to get rid of since I understand that the SC1435 is going to replace it completely.

- Also, Atari Computers come with a 90 warrantee, but they are
- offering a one year warrantee for $49 more.

Is this a Toad or Atari offering? I don't blame Atari for wanting to make an extra $50 on each computer.

3891. TeX 3.1/Metafont 2.7

Newsgroup: comp.sys.atari.st
Date: 1990-12-09 02:08:58 UTC
From: david@doe.utoronto.ca
Message-ID: <1990Dec9.020858.7035@doe.utoronto.ca>
Source record: 236602

Frank Ridderbusch has done a solid port of TeX 3.1 and Metafont 2.7
to the Atari ST, using GCC 1.37. He sent me the binaries and man pages.
I have tested the utilities on my home machine, and they seem to work
fine. This is a _complete_ TeX binary distribution in several files,
including such goodies as inimf, pktogf, etc. I suggested only one minor
change, which Frank implemented, and I have now posted the distribution
to atari.archive with Frank's permission. Here are the files:

bibtex.lzh
manpages.lzh
dvicopy.lzh
mf.lzh
tex.lzh
fontutil.lzh
mfware.lzh
texware.lzh

Happy TeXing!

You have to use either the "Supra Formatter" (as Dave Small points out in one
of the Spectre newsletters) or the "CMS Formatter", which is what I used. You
also MUST format on the Mac, since no mac SCSI software works with Spectre,
it can't seem to see any SCSI devices. I used the CMS software to format a
SyQuest cartridge for Mac & Spectre usage. As you said, you can't have an
Atari partition, although the Mac OS does allow for multiple partitions on
a drive. Hopefully, Spectre 3.0 will support a wider range of Mac formatted
drives. I'd love to have a cartridge with an ST partition on it that
autoboots and still have a Mac readable partition. Since formatting the
cartridge and putting a bunch of stuff on it, the volume crashed, although
Spectre still displays it under the hard disk menu. Of course, I hadn't backed
up anything on it yet (if I had, it wouldn't have crashed). I haven't had a
chance to try and restore the volume yet.

s37837k@saha.hut.fi (Jari Lehto) writes:

>If price does not scare you off, you should get the Cubase from Steinberg.

If the price does scare you off, you should try TWELVE from Steinberg. This is basically a stripped down version of PRO-24. It can handle only 12 tracks (hence the name) and it lacks some of the more advanced editing features of PRO-24. It can read patterns that were created with PRO-24, so you can use all the song disks that are available in this format.

The greatest advantages are:

- excellent support from the importer of Steinberg software (in the Netherlands that is). I received an update immediately, when I called them to complain about some bugs I had in the very first version. The copy I now have works flawlessly.

- The price. In the Netherlands it's only Dfl. 99,- which is about US$ 55.

One disadvantage: It does not like to cooperate with Turbodos. If Turbodos is installed, Twelve does not recognize media changes (disk swaps), so you can screw up a disk completely. I guess that if you have TOS 1.4, you don't have to use Turbodos, and the disadvantage disappears. When I use Twelve, I usually don't use the harddisk (otherwise I would not be able to hear my synths anyway :-)) and boot from a floppy without Turbodos.

I'm not a dBASE user, although I've worked some with dBASE clones, and
dBMAN seems fine to me. I have version V and it seems to do whatever I
read about in the dBASE books I have. The main problem I have with it
is that although it reads PC .DBF files fine, I can't get FoxPro or DBXL
to import dBMAN files -- then again, I haven't tried hard.

It would be interesting to hear from a more experienced database user.
Also, since dBMAN runs on many different platforms, how compatible is
the ST version with the Unix version and so on?

3903. Wordup 3.0 printing problem

Newsgroup: comp.sys.atari.st
Date: 1990-12-09 18:03:47 UTC
From: jmorton@euler.Berkeley.EDU
Message-ID: <1990Dec9.180347.9280@agate.berkeley.edu>
Source record: 236622

[I might as well get this in before everybody just throws away their copies of Wordup 3.0.]

I believe a couple of people mentioned that printing actually works for them. It doesn't for me, and I have a pretty ordinary printer, an Epson FX-85.

Text Mode:

There appears to be only one text mode driver, EPSONFX.TPD, which prints by going over each word twice. It also creates lines which are too long too fit without wrapping. Must one enter text in a certain way for text mode printing to work?

WP Mode:

The docs suggest reinstalling to switch drivers. Is it sufficient to just put the driver in the same directory as WORDUP.PRG? Has anyone had luck with any particular Epson driver? My printing problem occurs on the second page (an extra half-line of garbage), so it is very tedious trying all the possibilities.

Wish I'd kept 2.0 - it worked under certain circumstances.

I _do_ have the latest driver disk upgrade. The only new Epson thing on it is the EPSONFX.TPD, dated 6/19/90.

thanks if anyone has ideas ...

>I'm sure, that every multisync monitor can work with ST.

I'm afraid not. The ST puts out 70 video fields a second in monochrome mode.
This is outside the specs for the original NEC Multisync, and a lot of other
similar monitors made before IBM introduced VGA. Some of them work anyway,
but it has to be checked directly.

3906. ST login program

Newsgroup: comp.sys.atari.st
Date: 1990-12-09 23:29:50 UTC
From: scoile@gmuvax2.gmu.edu
Message-ID: <3089@gmuvax2.gmu.edu>
Source record: 236624

Are there any programs out there that can be run on an ST to provide some sort of login? We just recently got an Atari SH205 hard drive, and the people who are going to be using it have different ideas of what should be in the AUTO folder. We'd like to be able to customize the desktop, as well as having our seperate accessories, DESKTOP.INFs, whatever. The only way I can think of doing this is with some sort of login procedure. Anyone know? If something like this IS available, where can I get it (if not commercial, I have FTP access).

THANKS!

3907. Problem with gnu emacs.

Newsgroup: comp.sys.atari.st
Date: 1990-12-09 23:37:35 UTC
From: jones@ils.nwu.edu
Message-ID: <166@anaxagoras.ils.nwu.edu>
Source record: 236629

Hi, I have been running Edgar Roeder's port of gnu emacs V18.55 to the ST. Overall I'm very happy with it, but I have encountered a couple of annoying problems. This message is to ask if anyone has found patches or work arounds.

1. Filename completion causes the disk to thrash. The disk seems to do at least one, (sometimes two), seeks for each file in the directory in which the filename is being completed. With my sluggish supra drive, filename completion can cause the system to hang for 30 seconds or more.

2. Emacs sometimes crashes when it receives two quit signals (^G) in succession. This usually happens in the minibuffer, but beyond that I haven't been able to discover any general pattern. Actually, it's possible that emacs is not actually crashing. What usually happens is that I get thrown into gulam with some kind of weird error message, and then am unable to get back to emacs: ^Z causes the system to hang.

I have a Mega 2 ST and run emacs from gulam; gulam is in my auto folder.

One more question: is there any way to take advantage of the blitter chip and speed up screen updates when running emacs?

Thanks,

Eric Jones (jones@ils.nwu.edu).

I thought that the newer versions of the System from 6.0.3 were only little
changes due to the different hardware config. of Apples newer machines.

Source record: 236634

In article <166@anaxagoras.ils.nwu.edu> jones@ils.nwu.edu (Eric Jones) writes:
Hi, I have been running Edgar Roeder's port of gnu emacs V18.55 to the ST.
Overall I'm very happy with it, but I have encountered a couple of
annoying problems. This message is to ask if anyone has found patches or
work arounds.

1. Filename completion causes the disk to thrash. The disk seems to do at
least one, (sometimes two), seeks for each file in the directory in which
the filename is being completed. With my sluggish supra drive, filename
completion can cause the system to hang for 30 seconds or more.

I would doubt there's an easy fix for this. It doesn't sound like a
problem with Gnu EMACS, more like a problem with running it on a small
computer. Try using a disk cache, so all that grinding will be done in
memory.

2. Emacs sometimes crashes when it receives two quit signals (^G) in
succession. This usually happens in the minibuffer, but beyond that I
haven't been able to discover any general pattern. Actually, it's possible
that emacs is not actually crashing. What usually happens is that I get
thrown into gulam with some kind of weird error message, and then am unable
to get back to emacs: ^Z causes the system to hang.

Believe it or not, it's supposed to do that. On a multitasking system
you could re-attach to the process, but in TOS I'd assume you're just
plain screwed. The reason behind this is so you have a way to "REALLY
get out" in case Emacs gets confused and starts trashing your file
system or something. The fix is to become much more mellow about
pressing C-g (just once will usually do the trick.) I'm still
re-learning this is myself as older versions of GNU Emacs didn't do
this (A friend and I just installed 18.55 on a VMS machine, which had
version 16.somethin-or-other, and I ghot nailed by this a few times.)

Disclaimer: I use GNU Emacs on a day to day basis, but rarely use it
on my ST. And, the version I have on my ST was a different port. So,
my statements here reflect only my knowledge of GNU Emacs in general,
not of any specific port.

3914. Kermit/UniTerm/Vax Problem...

Newsgroup: comp.sys.atari.st
Date: 1990-12-10 04:00:58 UTC
From: vanleejf@udcps3.cps.udayton.edu
Message-ID: <1990Dec10.040058.24452@udcps3.cps.udayton.edu>
Source record: 236628

I am having problems using Kermit (in UniTerm Version 2.0e) uploading to a Vax system here at the University of Dayton. Specifically, while uploading a .LZH or .ARC file, I'll get about four packets into the transfer and then the Vax comes back with an error to the effect of: "Packet too large for internal buffer." I am in binary mode on my end and in server mode on the Vax (so that all of the settings should be automatically set). I download both .LZH and .ARC files fine, as well as uploading binary files (as long as they are not ARChives or LZHives). Any ideas?

Thanks!
Jim

I've been formatting my disks at 82/10 (828K -- the damn GEMDOS bug won't
recognize two sectors on the disk, so I don't get 830K) for 3 years, ever
since I've had an ST. No problems. I also format them with a 'twister' or
'skew' option. I recommend DC Format (version 3.2 is the latest, I think)
and Mystic. Mystic automatically formats with skew and the nice
thing is that it formats in the background. I also recommend DESKFMT
which is in RAMPLS12.LZH (or similar filename). I have NeoDesk 3.0
and TOS 1.6 so I use those.

>going to be secure). I have a program that formats 82 track and gives
>me near 800K is this OK?

Probably, but that depends on your particular drive. It's beyond the specs for the drive to ask it to go to track 81 (track 80 is the "official" max number of tracks.) There is no error returned from the drive if it can't get to track 80 or 81 (the first track is track #0), it will simply go to track 79 and act like everything is fine. The only time you'll know if it worked or not is if you fill the disk completely and see if all of the files are complete and intact. Some drives can do it, some can't. I don't even think you can generalize between manufacturers, it depends on the individual unit. If it works the first time, however, you should be able to count on it.

Some software will put extra sectors on every track, 9 is standard, I think, but some will try to go for 11. Once again, I don't think that you'll get an error if it fails. Instead of the head not making it to a track, as above, the extra sector method will try to keep writing sectors to the same track, hoping that the last sector doesn't overwrite the first one(s).

Some software will combine both of the above methods and can get up to around 1MB, I think. However, I advise you NOT to do this on your backup floppies. Especially not method #2 above. I just don't trust pushing the hardware beyond specs. I bet that over the months/years, you'd end up with a corrupted disk.

>Also what is the twister format, is this good?

Twister is to get better speed from the disk, not more storage. What happens is the sectors are staggered from track to track in such a way that reading long files will be quicker because you save some extra revolutions, the drive won't have to wait for the sector to spin under the head. Twister is reliable since it just staggers the sectors. You don't get any extra storage.

3922. Atari SH204 hostadapter with 'genuine' SCSI drives

Newsgroup: comp.sys.atari.st
Date: 1990-12-10 10:18:37 UTC
From: heiden@kboeng.enet.dec.com
Message-ID: <1990Dec10.110739@kboeng.enet.dec.com>
Source record: 236648

I would like to upgrade my original SH204 (with 20 MByte Tandon 262) with another drive.
As far as I understand the hostadapter inside the SH204 understands SCSI. Therefore I would
like to connect it directly to a 'genuine' SCSI drive instead of putting another MFM drive on the
Adaptec 4000 SCSI -> MFM controller.
Does anybody has experience with this solution ? What sort of problems could I run into ?
Any help is appreciated.
Thanks Matthias Heiden

>all of the settings should be automatically set).

I've noticed that with all the Unix C-Kermit implementations I've
tried, setting the packet size > 94 (on both ends) will cause sends to
fail, but not receives. This happens in binary mode (don't know about
text mode). I don't know whether this is a C-Kermit bug or a Uniterm
bug, but I don't think the behavior is exclusive to Vax systems. (It
happens to me with Suns too.)

Interestingly enough, I don't get "packet too large" messages; in my case
Uniterm just sends about 15 packets in rapid succession and then says
"too many retries". I've never discovered a solution; hence all my
uploads now run with 94 byte packets. :(

BTW, It does not seem to be the case (for me, at least) that server
mode sets all the params automatically...

>
>--Gregory

I agree speed is not a problem in the 040 NeXTs (I have talked to developers who due heavy applications on the SparcStation and now on the NextStation who also say there is no speed problems with the NextStation.)

But in comparing the TT (or any other computer) with the NeXT, speed is not (or should not) be the whole issue. What the NeXT has that gives it the advantage (in my opinion) is its integrated working environment. For example, putting graphics into TeX is a real pain. On the NeXT you can not only include PostScript graphics but you can *SEE* the included graphics on the screen previewer due to the Display PS. Then what you see is really what you get when printing. In addition, the Interface Builder is a major boon to developers-you build windows and general GUIs for your application by dragging pieces together in graphical environment(SUN has a similar, yet less advanced, design environment called GUIDE.) Lotus was able to design an entirely new spreadsheet (Improv) in only a few months due to the nature of IB (compare that with there own update of Lotus 123).

Also, NeXT is a different type of company than Atari--the NextStation was concieved as an idea in Jan, 90 and in production by Oct. Compare that to the TT development.

I've had an ST for years and love it. Many great and innovative products have come (and unfortunately gone). Atari's management has all but killed one of the great computers(The biggest Atari dealer in the DC area has closed, and the chain stores no longer carry ST software-mail order in the only way, so hopefully you got to see the software run somewhere else.) I've waited for the TT, but the only one I've seen (at AtariFest) was running Mac software. I'm tired of waiting so I defected(luckly being able to get an academic discount on a NeXT, otherwise the price would have put me out of the picture. NeXT is trying to fill in between workstations and PC's--PC types think NeXT hw/sw is expensive, workstation

type, SUN etc., think NeXT hw/sw is cheap.)

IF you can get the discount, and IF you have the money, the NeXT
is worth looking at, but I don't think most STer will be going
this way--too bad, they are a good group.

Finally one last thing(!)--an earlier post on this thread stated
that the NeXT was not a Unix machine--that's basically correct.
NeXT uses MACH for its OS. Mach supports multiple processors and
has a Unix like set of commands. It has been adopted by the OSF
as one of its standardized OS's. True Unix gurus slam it on the NeXT
since UUCP is not suported(yet works) and there is no SLIP, etc.
for "at home" communicating(the NeXT has built in EtherNet for
networking, but fails to recognize the at home networker.)

Well too much said--

>thing is that it formats in the background. I also recommend DESKFMT
>which is in RAMPLS12.LZH (or similar filename). I have NeoDesk 3.0
>and TOS 1.6 so I use those.

While I had my ST, I ALWAYS used 10 sector formats and I don't I
ever lost any data due to that. As Ed mentioned, you'll get
slightly speedier performance if you set the interleave for
1 sector. I always used HyperCopy and Format11 by Matt Orsie.
Almost any formatter will do the job, but you should look for
one that also VERIFIES the format to make sure everything is OK.
As for 11 sectors, well....it never worked on my ST and always
munged files. Apparently, your drive has to spin at EXACTLY the
proper speed (300rpm) for it to work. I wouldn't trust any
important data to this format.

Cheers,

Chris

I've gotten the 8/20/90 version of WUP3.0 to print (graphics mode)
on my EpsonRX80. I scrapped the assign.sys file they generate and
used a 'standard' one which lists the fonts to use and the FX80.SYS
device driver; I think their FX80 drivers are messed up. Printing
works fine now.

3930. Ghost mouse

Newsgroup: comp.sys.atari.st
Date: 1990-12-10 15:45:27 UTC
From: jvl@idca.tds.PHILIPS.nl
Message-ID: <1309@ssp18.idca.tds.philips.nl>
Source record: 236564

Hi,

I recently bought a new mouse. (For the people in the Netherlands:
the ACN mouse, bought on the HCC days a week ago).
The mouse looks very similar to the microsoft mouse, but is a little bit
larger. Also the left button is twice as big as the right one.
It has a very long tail. (about 1.5 meters).
At the backside the following can be read: "mouse for the Atari 520ST
and 1040ST".

Now my problem: Sometimes (about once in 5 minutes) the cursor starts
moving while the mouse is not touched! Most of the time it starts moving
to the right, shifting about 1cm / sec.
I sure the table is stable enough. The cable does not lie close to
a transformer and/or electrifical equipment.
I have never had such problems with my original atari mouse.

Has anyone seen such mouse behaviour before? Or does anyone even has
a solution or idea about this?

Any help/tips/ideas are welcome,
thanks in advance,
Jan

(Please respond by email if possible, I'll summarize).

I am very interested in programming in C on my new (used) Atari ST. I am curious what PD C compilers might be available and if they are any good. I got Lattice C version 3.03 with my Atari.. Is it possible to get an upgrade to this? (Is the company still supporting Atari).. Also what are considered the best C compilers that are not PD... Thanks ahead of time..

> ritchie@hpdmd48.boi.hp.com

I also have to agree with this. I have owned Atari's since 1979 when I bought my first 800. The number stamped on my mother board was 1121! I have seen Atari people and Atari dealers come and go. I have also lived with a lack of support. I do find that Atari has a product that is worthwhile and I do understand that they have their problems. We all hope that the future of Atari would be alittle more stable. However, we should appreciate the comments on this newsgroup from the employees of Atari. They are not responsible for the company itself and we should not expect them to sit through a bunch of verbal attacks on them or their company. The fact that they even care enough to post to this newsgroup is good enough for me...

Last I heard, Mark Williams company had a major hit with Coherent for PC compatibles. Their phone number was changed from the old 689-2300 to 291-6700 (both in area code 708). They were still supporting the ST C compiler, but plans for bug-fixes to the debugger and maybe the resource construction program had been dropped. The hottest project was to get a new version of Coherent out. If you want better contact information, you might find an ad in one of the PC magazines.

3936. Atari Archive News: Bart Changes

Newsgroup: comp.sys.atari.st
Date: 1990-12-10 18:27:51 UTC
From: brode@math.lsa.umich.edu
Message-ID: <1990Dec10.182751.1410@math.lsa.umich.edu>
Source record: 236551
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit

Those of you who use the mail server, Bart, to access atari.archive.umich.edu will notice a few changes.

There is a new line in the message headers to identify whom a request come from. The X-Requested-By: line is useful for preventing some abuses of the path command.

The other change is in the Subject lines. They used to read "filename.arc.uxx". Now they ready "filename.arc - part uxx of uyy". This is to help people retrieve large files by parts.

I also made a few changes to make Bart friendlier to the host machine, but that's not of much direct concert to y'all.

The most frequent request for a new feature is to have Bart is to handle requests for large files differently. Currently, Bart rejects requests for files that would exceed the quota. Many feel that it would be useful for Bart to send out as many parts as possible.

Just a reminder, we don't have quotas to cause you grief, we have them to placate our system administrator. Please don't try to subvert our quota system. I know it isn't tough to do, but don't do it anyway. We've caught a few people doing it and sent them (and their Postmaster) a message on net.etiquette.

BTW, for those of you who are used to mailing me at "dyer@math.lsa.umich.edu" should take note that my account name has changed.

Jon Brode -- brode@math.lsa.umich.edu

I've recently been looking over the version of Rufus posted to atari.archive and am quite impressed with the program. The only problem is that I DON'T speak/read any German. Are the author's of this program planning to eventually release an English version? (Or is there already one in existence?)

On a related note, I simply love the GEMINI replacement desktop...but I need to be able to use G+PLUS with it, and GEMINI seems only able to use fonts with AMCGDOS. Is there any way to work around this problem?

Thanks in advance for any answers given...

> in Unix so that I can use GNUTAR. (I'm tired of floppies...)
>
>

I wrote a SCSI tape TSR driver and a tar program to go with it that creates
and reads UNIX compatible tar tapes. I use it to backup my system and also
to bring home goodies I find here and on terminator (save time on the phone).
I have added features to tar that allows me to backup several partitions to
make use of the 60+ megabytes of tape I have. I have also added switches
when extracting files to ignore the drive (partition) and/or directory path
so that I can say: tar -cvb 255 c:*.* d:*.* e:*.* to backup everything.
If i want everything to go back to the repsective drives I just type:
tar -xv. Say I want to put files from c: to a partition on e: I cd to e:
and type: tar -xvd c:*.*. I can also ignore path information on the tape
so that I can extract files that are on tape say c:\bin*.prg to anywhere by
cd to where I want them and type: tar -xvs c:\bin*.prg. As you can see I
kinda bastardized tar by redefining the -d and -s switches. I can't delete
files from tape or update or any of that stuff yet so I used thoughs switches
for my own use. Anyway it works.

As soon as I figure out how to post to binaries and source I'll send the
stuff out as PD. Maybe somebody can improove on it (most likely :^)).

How many are you bringing in for domestic sale? The impressiveness of that statement(or lack thereof) is very volume dependent.

> Which tends to indicate:
> (A) STacy has passed FCC

The STacy only has a FCC class A rating and can only be sold for industrial and commercial business use. Sale to a private party(read: personal computer user) or operation in a residential district(read: your home) is a federal crime. Thankyou very much Atari, but that's useless to me.

> (B) We haven't dropped it

I wouldn't go patting yourself on the back for your fantastic promotion of it.

I think the latest version of DBman is 5.0 or 5.1. I have used an earlier version and found it very much like DBase III. It is a very powerful program, but I would not recommend it to someone who did not want to write customized applications. If you do write your own applications, the language has a number of features, some of which are not available in DBase.

Not to mention that the FCC and VDE require you to attach something to every
port which can conceiveably be used simultaneously. For FCC testing, these
peripherals have to be turned on! So you get their emissions and emissions
from the rat's nest of cables added to your own product's. For VDE testing,
the peripherals don't have to be turned on, but their cables still act like
antennae. Atari computers have so many ports, I'd hate to see the test set up.
=Especially= the TT's testing. That thing has more ports than you can shake
a stick at!

>I would like to upgrade my original SH204 with another drive.
>As far as I understand the hostadapter inside the SH204 understands SCSI.
>Does anybody has experience with this solution ? What sort of problems could I
>run into ?

This works for some SH204's. However, the power supply in the SH204 is
not beefy enough for some drives. The only way to tell is to see if it
dies. Therefore this is not recommended practice. In addition, the
host adapter might have the "old" PAL, not the "new" one, which won't
return some errors from the SCSI controller. This bit me recently: the
"old" PAL didn't return "write protected" from my Syquest drive, and
boy was I confused! The writes seemed to work, but the cached
directory etc. didn't match what was actually on the disk.

The "old" PAL has the number 60AC on it. If the little board in your
SH204 has a chip with that number on it, it won't return some errors
from the drive. I don't know how to get the "new" PAL - maybe dealers
can order it. Since the SH204 is not in production any more, this
might be hard.

Tee Hee. Actually, sorry to get your (collective) hopes up. I have just learned that RCS version 5, under copyleft and MUCH improved, is going to become available REAL SOON. I will port THAT, and it'll be much better than what I've done with version 4. So it won't be until the end of the year, I think. I just don't see the point of posting something when the new-and-vastly-improved version is coming.

(The improvements are in the internals; there aren't many feature improvements, and all files etc. are compatible. Still, it sounds like it'll make a big difference.)

If that were truly the case (I heard that too...) there shouldn't be
any change in the usability of the GCR as long as you use installer
for a mac plus, since that's what we're emulating. So my guess is
that they accidently changed something while working on the new stuff.

>certain way for text mode printing to work?

I haven't used it a whole lot, but I've at least gotten this working. The "Text mode" is intended to let you use the NLQ fonts built-in to your printer, if any. I've gotten pretty decent results on my Panasonic 1091i, writing a document in Courier font and printing in Text mode with the printer set to Courier font. There are two points to remember though - you're probably not going to get very good results using a proportional screen font unless your printer also has a proportional font. Otherwise, it's best to stick to a fixed-pitch font on the screen. I don't know the Epson FX85 off the top of my head, but my guess is it's a relatively old model, and doesn't do proportional spacing with its internal fonts.

The same might be asked for the the Modula2 compiler. We here at UT use
Modula 2 for one of our classes and I want to use my ST instead of the PC's.
However, the modula 2 compiler is all in German, even my fiance who speaks
German couldn't help me with it...

Is there an English Modula2 compiler somewere that I don't have to buy for
one class (oh boy, Derek is gonna flame me for this) and then probably never
use again?

>run into ?
>Any help is appreciated.
>Thanks Matthias Heiden

Well, I can tell you that I have had nothing but failure with this.
I used two mechanisms, the ST-157N and ST-296N from Seagate. I can
make a ST-251-1 work fine (using HDX 3.01) but have never, despite
repeated attempts, succeeded in making a 'genuine' SCSI drive work.

Now, if you're gonna take a stab at it, be sure to have an editor on the
disk with HDX on it so you can modify your 'wincap' file, or else have
another disk with the editor, etc. on it.

If you get this to work, please let the world now.

I do have one comment: MFM/ST-506 type drives are cheaper than
SCSI drives. If you're looking for price/performance, consider
some of the drives made by Maxtor/Colorado. They make a 70MB
19ms drive that really must work at about 5ms. (model 3085?)

Good Luck!

Source record: 236558

Bob_BobR_Retelle@cup.portal.com writes:

> Atari never stated that the STe was expandable... in fact, Allen Pratt
> tried to warn people about just this very possibility.

Just because Atari states that the STe is not an expandable machine, does not make it a wise marketing decision, and does nothing to satisfy customers. Atari needs to realise that customers are not idiots, and will want to do things (like expand memory) that they know to be industry standard, common practices. If, in some outdated hope of directing the machine purchasing of their customer base, Atari chooses to adopt an approach which goes against the wishes of their customers, they will ultimately pay the price associated with that kind of (outdated) strategy: they will lose their customer base.

More, and more the Atari machines are facing a challenge to maintain any kind of market share. If Atari is incapable of working to make these machines as competitive, in every sense, as those from other manufacturers, Atari will be truely relogated to the "also-ran" class.

> Atari puts in whateve
> parts are cheaper that week, SIPPs or SIMMs, without any concern about
> whether or not the end user will be able to expand the machine.

An approach which, years ago, most companies recognised as being one that comprises quality control, inventory management, and the manufacturer's ability to deliver product when the customer wishes to purchase. Maybe it is this mentality which sees Atari failing to deliver machines for the pre-Christmas buying frenzy. Good one guys!

3954. Job query

Newsgroup: comp.sys.atari.st
Date: 1990-12-11 00:32:13 UTC
From: hyc@math.lsa.umich.edu
Message-ID: <1990Dec11.003213.5149@math.lsa.umich.edu>
Source record: 236559
Cross-posted to: misc.jobs.misc,comp.sys.atari.st

[I have posted this with a distribution of "usa", but would not be opposed to sufficiently interesting opportunities in other countries... }-)]

Hello, netters...
I graduated in August with my B.S.E. in Computer Engineering from this fine engineering college here in Ann Arbor. I have been employed in varying levels from 50% to full-time in the College of LS&A, Dean's Office/Office of Information Systems for the past 3 years, and was a system programmer and consultant in the UM Computing Center before that. The past few years have seen my time split between LS&A central administration, the Computing Center, and contracted system administration duties in various departments throughout the liberal arts College.
Anyway, while I've gained a tremendous amount of system administration experience, I'm really a system programmer at heart, and I'm beginning to grow a bit restless in my current position. If you know of any interesting positions available, please drop me a line. To give you a little more background, some of my past work includes debugging of NFS in the Mt Xinu Vax BSD 4.3 kernel, work with Ciprico SCSI device drivers on Sun-3 VMEbus systems, optimizing an X11 server for Apollo DOMAIN, plus many application level projects. These include porting ARC 5.21 from MS-DOS to BSD and Sys V Unix, work with C-Kermit on Unix, porting the KA9Q TCP/IP package to Atari ST, and others. I have been programming in C for over 5 years now, and also have extensive experience with 68000, MIPS, SPARC, IBM 370, and 8086 assembly languages. I am familiar with many operating systems and TCP/IP networking options for most of them, including VAX VMS, MSDOS, MacOS, and some other more obscure systems. I have working knowledge of how to get these heterogeneous systems talking to each other.
My preferences are for Unix-based work in a well-connected networking environment. I also have a preference for Atari STs as primary workstations. However, I have used Suns, Apollos, DECstations, and NeXT systems and can manage all of them if necessary.
This posting is getting a bit lengthy, so I'll stop here. Please e-mail responses, a formal resume is available on request.

Message-ID: <9012110335.AA11156@sun.soe.clarkson.edu>
Source record: 236593

A few months ago I got ahold of dBMAN version 2.00 L (as VERSION() reported)
and thought it was GREAT that I finally had a dbase III compatible database
manager for my Atari ST!!!

The opinion I formed soon after trying it out... YUCK.

I will not dwell on my bad Opinion of dBMAN since I have learned that the
newest version is IV, and is available for 37 different platforms.

It is very possible that the problems and bugs I encountered no longer exist.

I have been writing hardcore dbase code for quite a while now,
well... CLIPPER code, which is BETTER!

3960. Arcgsh 3.5 posted

Newsgroup: comp.sys.atari.st
Date: 1990-12-11 09:50:16 UTC
From: klute@tommy.informatik.uni-dortmund.de
Message-ID: <2847@laura.UUCP>
Source record: 236572

I just sent Arcgsh 3.5 to Steven Grimm, the moderator of comp.binaries.atari.st, and also uploaded it into the "new" directory on atari.archive.umich.edu. It comprises several bug fixes and extensions (see below).

Arcgsh is a program that eases the calling of the well-known archivers Zoo, Arc, LHarc and Shar. Furthermore the programs Uud and Uue are supported to let you decode resp. encode binary files for handling with e-mail. You can use your favorite file viewer and your favorite editor from Arcgsh without any need to leave the program.

New in this version (since Arcgsh 3.2):

- Arcgsh now supports the ARGV extended parameter passing scheme in addition to the xArgv parameter passing scheme. This is especially useful for working with Zoo, because parameter strings longer than 125 characters can be handed over now. The ARGV and xArgv parameter passing schemes are available to registered users only.

- Zoo did not work properly when Arcgsh was called from the Gemini shell by dragging a Zoo archive file to the Arcgsh icon on the Gemini desktop. Fixed. (Technical note: This problem was due to the fact that Gemini supports the ARGV parameter passing scheme and Arcgsh did not. Furthermore Zoo did not notice the ARGV environment was not set up for itself but for Arcgsh.)

- A new option "Zoom boxes" has been introduced. If this option is active a growing box is drawn when a window is opened and a shrinking box when it is closed. This was Arcgsh's normal behavior in former versions. When you disable this option the "zoom" boxes are not drawn and you will get a little speed gain in the dialogs.

- The dialog boxes for Zoo, Arc, LHarc, Uud, and "other program" as well as the file selector for "show file" and "edit file" can be invoked from the keyboard now. The keys that start a certain function are listed at the right hand side of the menu entries within the "File" menu.

- A new option "Repeat last dialog" has been introduced. If this option is active the dialog that was called last will be repeated automatically until it is left with the "Cancel" button. Example: After Zoo has executed the Zoo dialog box appears on the screen again automatically.

- Under certain circumstances the automatic startup inserted "arcgsh.rsc" as the archive file. Fixed.

>
> --
> John Schmitt
> johns@maccs.dcss.mcmaster.ca
> ....!unet!utai!utgpu!maccs!johns

Quoting from ST Applications (December 1990) :

"The TT Desktop is 22K larger than the current ST GEM Desktop, and Atari have confirmed that it won't appear in future versions of the 192K TOS Roms used in the Atari ST. But the Atari STE uses 256K TOS Roms (30K of which isn't used), and programmers at Atari Systems Software Division have indicated that Atari will bundle the TT Desktop in future versions of the STE's Roms."

So If you have dont have an STE (which you dont, as you are contemplating an upgrade to 1.4 Roms) the it looks like the answer is NO. Its a real shame, I'd love to fit it too.

DO NOT go for PC Ditto (the software version, not PC Ditto II which I've never tried) as it is terminally slow... The fastest its ever reached was a Norton of 0.3 - about one third the speed of a 4.77 MHz IBM PC, the slowest it ever reached was a Norton of 0.0... It is fine if all you want to do is a run a few programs now and again, but otherwise is totally useless.

3965. Question: Networks for ST computers

Newsgroup: comp.sys.atari.st
Date: 1990-12-11 13:02:33 UTC
From: cb01@cs.vu.nl
Message-ID: <8476@star.cs.vu.nl>
Source record: 236514
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

G'day,

Can somebody please fill me in about the available networks
for atari ST computers? I've been working a while with a net
called ITOS but that _really_ doesn't work! A couple of days
ago I watched a demonstration of the BIO-net: this seems to
work great but is quite expensive (about fl.2600 (app. $1550)
per node) and because my net may grow > 10 ST's I'll need a
fa(s)t server. Summing up interfaces, ST's, drives and the
server I reach the fl.50000 (app. $30000) easily. This, I think,
isn't worth the bennefit of having bit-mapped-'intellegent'-
ST-terminals over character-terminals connected to some
bigger server (SPARC stations aren't that expensive!!).
I heard some rumours about ATARI launching their own net...
...
...
does anybody know anything about it? Is this a regular *ATARI*
anouncement (which means it will be available somewhere in
1994) or is it serious this time?

please, let me know if you heard *anything* (and I mean anything)
about some of this!!

greetings,

Joep Vesseur

3967. Archive Starter Pack

Newsgroup: comp.sys.atari.st
Date: 1990-12-11 13:25:26 UTC
From: J.D.Coleman@newcastle.ac.uk
Message-ID: <1990Dec11.132526.8281@newcastle.ac.uk>
Source record: 236579

I have just uploaded an archive starter pack to Atari.Archive. It contains the following :

arc / lharc / uud / uue / zoo
U. Michigan monthly posting (05 Dec 90)

The file is 'starter.tos' and is in the form of a self-extracting lzh archive, so only needs to be downloaded (in binary mode !) and run. The archive contains sudirectories and needs about 350k when extracted.

3968. Bible Concordance Program

Newsgroup: comp.sys.atari.st
Date: 1990-12-11 13:31:17 UTC
From: mcli@joker
Message-ID: <10994@ur-cc.UUCP>
Source record: 236513

Hi everyone,

I'd like to just tell everyone about a program I found at the panarthea archive earlier this year. I have wanted to post something about it, but never had time to write a formal review. This is more or less an informal review.

The program is called the Spiritware Concordance program. It is a Freeware program written and supported by a church in Seattle, Washington (the Fifteenth Avenue Bible Church, I think). They call the software they write "Spiritware". Good name, huh?

The Spiritware Concordance program comes free with the King James Version of the Bible, since the KJV text is in the public domain. The New International Version is also available. They get it directly from the Zondervan publishers, and it is *not* in the public domain. So you have to buy it.

Time doesn't allow me to go too deep into describing the program features, but I will highlight the features that I think are the most useful:

- selective searches of the books of the Bible.
-you can limit your search to one book, or any books.

- you can search using wild cards.
-for instance, bapt+ would search for baptism, baptist, baptize, etc.

- exclusive or inclusive searches.
-verses with [word1] and [word2], or [word1] or [word2], plus combinations of and's and or's.

- exporting of Biblical text to file, or printer.

- a notepad to take notes on.

- footnotes (for NIV version)

- the words you are looking for are bold faced.

- you get three windows, one for inputting the words you want to search for, one which lists the verses that contain the search words, and one that contains the actual text. Moving down the list of verses, the text window goes to the appropriate verse, and it's context.

- Other features include bookmarks, going to a specific reference or book, etc.

This program is really superb and is fairly fast. I don't have any time comparisons, though. It's excellant for those who want to study the Bible or lead Bible Studies.

The program runs on any ST computer with any drive configuration. A hard drive is recommended but not required. Each version of the Bible is about 2.5 megs, and comes on 4 disks.

If you register your program, you get impeccable support from FABC. They send you a manual for the program, and any future updates for free. I forget the registration fee, but It's something like $15.00 or something. Since I've registered in June, I've received the manual and one update, which was updated again because of a small bug. Inf fact, you don't even need to ask them to send you the update. If there's an update, they send it to you right away.

I believe that they are working on a Greek version of the Bible also. If you're interested, I can post the address of FABC and send the program to atari.archive.

-Maurice

From: suhonen@kunto.jyu.fi
Message-ID: <SUHONEN.90Dec11161535@kunto.jyu.fi>
Source record: 236519

In article <665@organpipe.UUCP> dkoski@hercules.as.arizona.edu (David Koski) writes:

I was wondering how much memory is required to run TeX? Also, about how
much HD space is used? I would probably want TeX and a dvi viewer and fonts
for the dvi viewer.

It depends... My ST-TeX (TeX version 2.1) eats about 720K RAM, It is fast,
but some of it's defined arrays are too small; font array is absolutely too
small. So, I can run my TeX from gulam in my 1Meg ST. The distribution I got
eats about 4 meg diskspace, but I have carried some more stuff into my TeX
partition (totally 7.5Meg) and it eats now about 6Meg.

If you get a pd TeX (like CommonTeX) and version under 2.99 you can run it in
one Meg (not sure..) but there are versions for 2 and 4 meg systems as well.
(new) TeX 3.0 (3.1) needs more memory. If I remember correctly, you can
run new TeX in 2Meg, but... well, better not to say any more: I'm not sure
about things here..

In general: My ST-TeX's manual says something like: " A wizard can make ST-TeX
run with a single DD floppy... ". You can cut the disk usage under 2 Meg,
but then there is not much you can do with your TeX. It's not hard to make
your TeX system use much more than 10Meg disk space and thats what I'm gonna
do as soon as get a bigger hd... B-)

> run into ?
> Any help is appreciated.
> Thanks Matthias Heiden

I have hooked a Maxtor XT-4380S , XT-4380E w/ Emulex SCSI->ESDI card,
a Wren 6 SCSI drive and a Cypher 540 SCSI cartridge tape drive to my SH204
host adapter. I've only had problems with the Wren.
The SH204 only supports 1 SCSI device and it must be selected as device 0.
The SH204 host adapter also only supports level 1 SCSI commands (thoughs
requiring 6 byte CDB's only).
I use the Supra driver and utilities selecting the 'OTHER' controller type.
Once the device is formatted, I use a utility I wrote that analyzes the
media and performs the SCSI reassign block command on defects it finds.
I then go backinto the Suputil and make the device bootable.

I would recommend to ANY ST user that they get a subscription to Current Notes magazine. I believe they are now $27 per year. They have great reviews, and will actually tell you that something is caca (I have never seen STart do that, though they have reviewed some real dogs). This mag started out as a newsletter for several large Atari Users Groups in the DC area, and just kept getting bigger and better. They also have a great PD library, and are commited to keeping it up to date (for example, I was told that I could send my purchased PD disk of whatever version n and they would put version n+1 on it for free). I have bought disks from places and found them to have bad arc files, old versions, files missing (No .rsc! Arrrgh!) etc. I have never had these or any other problems with CN. For those of you that use the Spectre, there is a monthly column which discusses this. Whenever I meet a new STer (it actually happens quite frequently, by the way), I always show them an issue, and as of yet they have ALL bought subscriptions. The mag is thick and meaty, no color adds. It is produced completely on an ST system (and it looks really nice, I belive they use a combination of Pagestream, Calamus, and Publisher ST). This mag can cure the MAIN problem with most STers in the US, mainly that they don't know about what is available, and don't want to find out the hard way. Reviews are the main emphasis in this mag, not marketing/advertising crap.

The address for CN is :

Current Notes Subscriptions
122 N. Johnson Rd.
Sterling, VA 22170
(703)450-4761 $27 for 1 years subscription
(10 issues, they skip aug and jan)

If you call them, you may be able to arrange ordering just one issue, to check it out. They are also sold in several book/magazine stores in the DC area, and at some Atari dealers (chicken and the egg . .).

I am in no way connected with CN, other than as a satisfied customer. So satisfied in fact, that I bought all their back issues so I have a complete library of ST info (how many of you can say THAT?!?). If you are a somewhat discouraged ST owner, $27 is a lot cheaper than a new computer!

>BITNET=bill%biomel%dalcs@dalac InterNet=bill%biomel@cs.dal.ca

All that stuff was about preparing a hard disk that can be used on a real
Mac as well as under Spectre emulation. In short: Spectre < 3.0 supports
Mac disk formats from an older System/Finder (probably from when the
Mac first got hard disk support).

An advantage of a compatible disk format would be to share files between
a real Mac and ST with a Syquest 44Mbyte removable cartridge. These files
could be, say, 15 Mbytes of public domain Mac stuff.

The bare Syquest drive with one cartridge is $468 in an add in MacUser.

If you don't need to share a drive, your setup is fine.

Note that the older format Mac scheme of Spectre 2.65 and below has a
maximum `disk' (Mac didn't really have partitions then) size of 32 Mbytes.
Spectre 3.0 uses a format that allows Mac partitions of 256Mbytes.

>use ICD's recent version. Has anyone out there done this and could they
>Pleeeze give me some tips.

You can *NOT* format a hard disk on the ST that both a Macintosh
and the Spectre can use. The partition map that Atari defined for the
ST is not compatible with the partition map that Apple defined for
the Mac. This will stay true no matter whose partitioning software you
use on the ST.

Spectre does *NOT* repartition the hard disk or change
the format of the partition map to the format Apple uses. Spectre just
changes the type of the partition to 'ACK' (or 'OOP' in version 3.0)
instead of 'GEM' or 'BGM' or whatever. After Spectre changes the
partition type in the map it then writes a Macintosh file system (MFS
or HFS) in the partition.

You can format/partition hard disks on the Mac and then use
that hard disk with Spectre. This works great, especially with removable
media drives. (With Spectre 2.65 you need to use older Mac formatting
software since it doesn't understand the new Mac partition maps.
Spectre 3.0 supports both the old and new Mac partition maps.)

> ....Yonderboy@cup.portal.com

I believe Lattice is still supported in Britain, and that they have come out with a recent upgrade that is quite nice. I think it does not receive much attention in the US because of Mark Williams C and Laser C (both in-country products). In the PD realm, the two biggies the I have heard of are Sozobon and GCC. GCC is superb, but you need at least 2 megs to compile large programs (4 would be a better idea). It is worth it to ftp GCC just for the docs, lots of good info there. Sozobon seems to be solid, but I believe there are some documented bugs. Another compiler that I am impressed with is Prospero C. This is another British product that optionally supports the ANSI standard, and is rock solid. The Prospero company also produces both FORTRAN and Pascal, and one can cross-link the object files from any of the three with any of the three (does that make sense?). All of the Prospero compilers have great documentation (>1000 pages), and are well supported. They also produce a source level debugger, and provide .ttp versions for use under a shell. The programming environment is the same in all three compilers, which is nice if you have to switch between them.

As always, this is IMHO.

From: david@doe.utoronto.ca
Message-ID: <1990Dec11.175303.22275@doe.utoronto.ca>
Source record: 236585

I just downloaded unixmode.lzh and unix2dos.lzh from atari.archive.
Unixmode is a little confusing (how do you use the 'd' argument
to create /dev/A /dev/B, etc.?), but unix2dos even more so. Does
it go in the auto folder? Does the UNIXMODE environment variable have
to be set first, before I run unix2dos? Does it work with non-GCC
programs (it doesn't seem to, so far)? Thanks for any help.

Syquests, or other removeable hard disks, so that you can just pop
them in to either machine. Do I get the 64K dollars?? 8-) 8-)

> This sounds very knowledgable and I'm busily trying to figure it out. I
> have a Supra 80 with three Atari partitions and two Mac HFS partitions
> which I formatted with GCR 2.65, following the manual instructions.
> If I understand the above postings correctly, this is impossible.

Lucky you; I trashed 2 or more of my 6.05 system disks while getting
my floppies to read/write GCR (crash - reboot, floppy all screwed). I
have only myself to blame, I didn't check to see if I could copy GCR
disks with 1 working drive under Spectre itself - of course you can
(Darn)!
New owners, make sure you back up your system disks in
Spectre (check under "FLOPPIES") BEFORE you risk trying to boot up for
real - if a disk isn't "ejected", it is MUNGED!!! This *seems* to be
true of write protected disks too, in any case, use f1(A), f2(B) to
get Spectre to recognize the insertion of a write protected disk. As
an aside, I consider the incomplete nature of the auto disk insertion
feature to be a bug - please fix in 3.0 guys (just check the write
protect line while the disk is sliding in or out <use the vbi or
something similar> - non tricky drives will indicate a second or so of
no of write protection, and mods for the "tricky" drives are usually
trivial, I've done it on my Teac).
At least I'm almost ready, the floppies do test out ok now.
However, the June '90 article "Fixing NEC Mechanisms!" in Current
Notes is incorrect for Nec 1035 mechanisms - short L3, *NOT* L7. Oh
well, I still have to clear off the last partition on my hard disk for
Spectre anyway 8-(.

> What's going on?

Just a problem swaping Syquests between an ST and a Mac I believe.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I am just starting to really get into the swing of working with my new St
and have seen some of the advanced options available for the ST and have
been impressed. What I would like to know is what is the best frame grabber/
video digitizer for the St. I have seen some of the work that Computer eyes
does and frankly I wasn't really all that impressed because it distorted colors
badly. However I am aware that there is some program put out by the same
compay that make computer eyes that apparently improves the color quality
drastically. Unfortunately I have not seen this in action. I am a amateur
turning pro video producer and would like something that digitizes the screen
from a VCR source so that I can alter the picture later. Thanks for any
help I get!
Thanks,

Thomas

There is a third party software product called UltraScript, done by Imagen Corporation (a subsidiary of QMS), and marketed through Atari, that prints PostScript files quite nicely on the SLM804 Laser printers.

Retail list price on the SLM804 is $1,295.00. UltraScript lists for $229.95 (U.S., as of Sept. 1, 1990).

3984. how is a .spc file encoded?

Newsgroup: comp.sys.atari.st
Date: 1990-12-11 19:31:20 UTC
From: gwoho@nntp-server.caltech.edu
Message-ID: <1990Dec11.193120.3127@nntp-server.caltech.edu>
Source record: 236594

how is a .spc file encoded? any hints would be helpful, for example, how big is the bitmap, is there a color palette? how many bits per pixel, etc. i would like to know exactly how it is encoded, so i can write a program to decode them, but any hint would be good, and i might be able to look at the file and figure the rest out.
also, how are .arc files encoded?
gwoho liu.

3985. Re: C Programming Languages...(Lattice)

>to this? (Is the company still supporting Atari).. Also what are considered
>the best C compilers that are not PD... Thanks ahead of time..
> ....Yonderboy@cup.portal.com

Well, I'll sum up my experience with C compilers...

Megamax C (commercial, probably not available anymore)
I used to use this compiler from a ramdisk on my old 520 ST. My impression is that this is the best C compiler for someone without a hard disk because it will all fit on a ramdisk and it's very fast. It has a few bugs (not too bad, though) and some irritating quirks due to its one pass nature, but that's the price you pay for a small, fast compiler... Its not suitable for large projects because it only uses relative addressing, but for small projects it can generate smaller, faster code than anything else I've used.

Laser C (commercial)
This is my compiler of choice. (I now have a mega 2 and hard disk, not really necessary with this system, but any development is unnecessarily painful without a hard disk) This compiler is super fast, the source level debugger is great, and it can produce great code if you know how to write for it. It also allows inline assembly with full access (by name) to all variables, which I need. Its a one pass compiler which means its more finicky about the code it will accept than most 2-3 pass compilers; porting unix code is almost always a pain.

Mark Williams C (commercial)
A good solid compiler, but too slow for my patience level; a hard drive is all but required. Accepts more C flavors than Laser C, much better for porting (non-ansi) unix code. Both have good documentation. The assembler is painfully non-standard. Generated code is bigger than Laser C.

Prospero C (commercial)
The only Ansi compiler in this group. This compiler works well, but I don't really like it. The linker is not smart, so all executables tend to be quite large. This is the only compiler listed that will not let you change the run-time start up module, which I think is unacceptable (to me, anyway) Some of the Gem bindings have different names than the other compilers, which makes porting Atari programs harder than necessary. It also compiles fairly slowly, even on a hard disk. On the plus side,

this compiler also works together with the prospero assembler, fortran, and pascal compilers (all of which are sold separately). The docs are good, the support is actually quite good.

Sozobon C (public domain or freeware)
A good compiler, generates good code. When you have trouble, though, you're in for a fight because this compiler has the worst documentation in the group. What do you expect for the price? I think language documentation is very necessary. Once you figure out the compiler and your libraries of choice, though, this product works well. Comes with source code, which is great and very interesting. If your time is worth very much, I would get a commercial compiler with documentation and a source level debugger...

So there's my opinions, for what they're worth. I haven't used Turbo C, Lattice C, Aztec (manx) C, or the atari GNU C compiler, so other's might wish to add something on these. Note that my emphasis has always been on writing code for the Atari, so Laser C is my choice. Anyone porting from a unix box would almost certainly find another compiler better...

>The STacy only has a FCC class A rating and can only be sold for industrial
>and commercial business use. Sale to a private party(read: personal computer
>user) or operation in a residential district(read: your home) is a federal
>crime.

Are you sure about that last part (i.e., that operation of a class A
device in your home is a federal crime)? I agree that selling it
for use as a personal computer is illegal, and that it is likely
to cause unacceptable interference if used in a residential area,
and that it is your legal responsibility as a user to cure the
interference. But is it actually illegal simply to operate it?

If you make that statement as one who actually knows, can you site
your authority for making it? If not, can someone who is authoritative
answer the question?

(BTW, I speak for myself, not Atari, and I can neither confirm nor
deny that "STacy only has a FCC class A rating".)

What?! This makes no sense whatsoever. What is it about the NeXT that
makes it "not much of a Unix box"? Unix is designed to run on all sorts
of vanilla hardware. Of course, it runs well on fast hardware, which the
68040-based NeXT certainly is. If anything, the NeXT is more than just
a Unix box, considering its audio-visual capabilities.

Well, I *DON'T* want WordUp, based on what I've read in c.s.a.st. I've had all the fun I can stand, with TurboJet and Neocept. (Thanks again to those of you who offered to help me out, or are helping me.)

HOWEVER, I do want to add my endorsement for E. Arthur Brown Co. This may be the premier source for ST software and goodies, at least for the foreseeable future. Other stores may have more software, but you can't beat EABCo's prices, and their service is impeccable. I've had many dealings with them, and never been disapointed or mistreated.

Only my opinion. My employer doesn't care.

3991. Hard Disk Problems

Newsgroup: comp.sys.atari.st
Date: 1990-12-11 22:21:03 UTC
From: ac365@cleveland.Freenet.Edu
Message-ID: <9012112221.AA05024@cwns1.INS.CWRU.Edu>
Source record: 236534

I have an Atari Mega 4ST with a Syquest 44 megabyte removable hard drive running with an ICD host adapter and system software. My original system used an Atari Megafile 30 HD and everything worked fine. Then I added the SyQuest44 as a second HD and problems started. I switched the Syquest to DMA 0 and removed the Megafile 30 thinking that the computer was having trouble managing two hard drives. This helped, but it didn't really. I then removed the special features provided like read/write caching and write verifies. Reliability improved tremendously. I was no longer getting persistent write fails, missing files, and accidental deletes.

My current problems include files getting mistakenly trashed. That is, a file which I never saved onto is getting truncated and corrupted. It is like the disk table isn't being done correctly and the computer uses the same sector twice. Also, sometimes two quite dissimilar files become merged. I have my biggest problems with large files. Maybe its just the law of averages which allow larger files to be corrupted easier. For example animations are prime candidates; however, there isn't always a rhyme or reason to the corruption.

Also, sometimes when the hard drive should not be called for, the head engages (I can hear it) and the red light comes on for a couple of seconds. Then everything returns to normal. The computer's operation isn't affected at all during this "blip".

What can be done to stop these problems?

Thanx in advance!

From: billm@CSUFresno.EDU
Message-ID: <1990Dec11.222532.27455@CSUFresno.EDU>
Source record: 236597

I haven't seen any of the ST mags recently, but I recal that a few years back, Supra came out with a 10 meg 5.25in. Floppy drive. It was supposed to be faster than a normal floppy, though still slower than an HD. Can any one tell me if these are still manufactured, and better yet, if they are any good? I am planning on purchasing Spectre GCR, and wouldn't mind if I had only 10 Meg, if I was able to swap it for an Atari 10Meg etc.
Please respond vie e-mail if possible.
Be seeing you...

I think this is a neat idea, and could be one of the more constructive uses of this group, especially with the death of local dealers (at least for us USA folks). What I was wondering, though, was if you could post a short description of what the program does and why you think it is so useful, (along with any ordering information you might have), instead of just listing titles. Some of the programs listed above I've heard of and agree that they are quite useful, while others I've never heard of before. Since it looks like I'm going to be buying my ST stuff by mail order from now on, this information would be invaluable to me (and I suspect, quite a few other people).

So what do the rest of you think? Would this kind of information be useful? Is posting it an appropriate use of this group?

MV010320@NDSUVM1.BITNET (Thomas) writes:

- What I would like to know is what is the best frame grabber/ video
- digitizer for the St. I have seen some of the work that Computer
- eyes does and frankly I wasn't really all that impressed because it
- distorted colors badly.

Computer Eyes I think is the best, or at least, the most popular.
(We all know that most popular doesn't mean the best. :^) It only
digitizes in 16 colors, but read on....

- However I am aware that there is some program put out by the same
- compay that make computer eyes that apparently improves the color
- quality drastically. Unfortunately I have not seen this in action.

There is a desk accessory called DIGISPEC which allows you to use
Computer Eyes and digitize 512 colors on the screen at once. This is
written by a company called Trio Engineering which also wrote
Spectrum 512, the 512-color drawing program which preceded DIGISPEC
and Unispec, a 512-color animation program. I have seen results of
the Computer Eyes and DIGISPEC combination, but have never seen it
being done. Antic used to distribute the programs, but I'm not sure
if they still do. You can find them via mail order or if you have a
good local dealer.

- I am a amateur turning pro video producer and would like something
- that digitizes the screen from a VCR source so that I can alter the
- picture later. Thanks for any help I get!

DIGISPEC will allow you to change brightness, contrast, hue
saturation and a couple of other things, like convert GIF pictures to
SPC (Spectrum Compressed) format. Spectrum 512 will allow you to
manipulate the images, like cut and paste, add colors, gradient
fills, etc.

Hope this helps.

PackBits Compression Algorithm

Introductory Information
----
word = 2 bytes
long = 4 bytes
palette = Hardware color palette, stored as 16 words. First word is
color register zero (background), last word is color register
15. Each word has the form:

```
Bit: (MSB) 15 14 13 12 11 10 09 08 07 06 05 04 03 02 01 00 (LSB)
-- -- -- -- -- -- -- -- -- -- -- -- -- -- -- -- --
0 0 0 0 0 R2 R1 R0 0 G2 G1 G0 0 B2 B1 B0
```

R2 = MSB of red intensity
R0 = LSB of red intensity

G2 = MSB of green intensity
G0 = LSB of green intensity

B2 = MSB of blue intensity
B0 = LSB of blue intensity

Intensity ranges from 0 (color not present) to 7 (highest
intensity).

Example: { red = 7, green = 3, blue = 5 } -> 0735 (hex)

Caveat: It is wise to mask off the upper four bits of each
palette entry, since a few programs store special
information there (most notably Art Studio).

The Formats

<NEOchrome> *.NEO

1 word flag byte [always 0]
1 word resolution [0 = low res, 1 = medium res, 2 = high res]
16 words palette
12 bytes filename [usually " . "]
1 word color animation limits. High bit (bit 15) set if color
animation data is valid. Low byte contains color animation
limits (4 most significant bits are left/lower limit,
4 least significant bits are right/upper limit).
1 word color animation speed and direction. High bit (bit 15) set
if animation is on. Low order byte is # vblanks per step.
If negative, scroll is left (decreasing). Number of vblanks
between cycles is |x| - 1
1 word # of color steps (as defined in previous word) to display
picture before going to the next. (For use in slide shows)
1 word image X offset [unused, always 0]
1 word image Y offset [unused, always 0]
1 word image width [unused, always 320]
1 word image height [unused, always 200]
33 words reserved for future expansion
16000 words picture data (screen memory)

32128 bytes total

<NEOchrome Animation> *.ANI

NOTE: To get this feature on versions 0.9 and later select the Grabber
icon and click both mouse buttons in the eye of the second R in the
word GRABBER.
Interestingly enough, some versions of NEO only require you
to press the right button, not both. Hmmm...

1 long magic number BABEEBEA (hex) (seems to be ignored)
1 word width of image in bytes (always divisible by 8)
1 word height of image in scan lines
1 word size of image in bytes + 10 (!)
1 word x coordinate of image (must be divisible by 16) - 1
1 word y coordinate of image - 1
1 word number of frames
1 word animation speed (# vblanks to delay between frames)
1 long reserved; should be zero
----
22 bytes total for header

```
? words image data (words of screen memory) for each frame, in
order

<DEGAS> *.PI1 (low resolution)
*.PI2 (medium resolution)
*.PI3 (high resolution)

1 word resolution (0 = low res, 1 = medium res, 2 = high res)
Other bits may be used in the future; use a simple bit
test rather than checking for specific word values.
16 words palette
16000 words picture data (screen memory)
-----------
32034 bytes total

<DEGAS Elite> *.PI1 (low resolution)
*.PI2 (medium resolution)
*.PI3 (high resolution)

1 word resolution (0 = low res, 1 = medium res, 2 = high res)
Other bits may be used in the future; use a simple bit
test rather than checking for specific word values.
16 words palette
16000 words picture data (screen memory)
4 words left color animtion limit table (starting color numbers)
4 words right color animation limit table (ending color numbers)
4 words animation channel direction flag (0 = left, 1 = off, 2 = right)
4 words 128 - animation channel delay in 1/60's of a second. [0 - 128]
(I.e., subtract word from 128 to get 1/60th's of a second.)
-----------
32066 bytes total

<DEGAS Elite (Compressed)> *.PC1 (low resolution)
*.PC2 (medium resolution)
*.PC3 (high resolution)

1 word resolution (same as Degas, but high order bit is set;
i.e., hex 8000 = low res, hex 8001 = medium res,
hex 8002 = high res). Other bits may be used in the
future; use a simple bit test rather than checking
for specific word values.
16 words palette
< 32000 bytes control/data bytes
4 words left color animation limit table (starting color numbers)
4 words right color animation limit table (ending color numbers)
4 words animation channel direction flag [0 = left, 1 = off, 2 = right]
4 words 128 - animation channel delay in 1/60's of a second. [0 - 128]
(I.e., subtract word from 128 to get 1/60th's of a second.)
-----------
< 32066 bytes total

Compression Scheme:
```

PackBits compression is used (see below). Each scan line is compressed separately; i.e., all data for a given scan line appears before any data for the next scan line. The scan lines are specified from top to bottom (i.e., 0 is first). For each scan line, all the data for a given bit plane appears before any data for the next higher order bit plane. Note this is identical to the IFF 'BODY' image data.
To clarify: The first data in the file will be the data for the lowest order bit plane of scan line zero, followed by the data for the next higher order bit plane of scan line zero, etc., until all bit planes have been specified for scan line zero. The next data in the file will be the data for the lowest order bit plane of scan line one, followed by the data for the next higher order bit plane of scan line one, etc., until all bit planes have been specified for all scan lines.

Caveats:

DEGAS Elite's picture loading routine places some restrictions on compressed DEGAS files:

o Elite uses a 40-byte buffer to store data being decompressed.

o Whenever a control command is encountered, bytes are stuffed in this buffer.

o The buffer is only emptied when there are EXACTLY 40 characters in it.

The important conclusion here is that

No control command may cause the buffer to have more than 40 bytes in it. In other words, all control commands must end on or before the 40-byte boundary.

Any picture violating the last condition will cause Elite to get a bus error when the picture is loaded.

<Tiny> *.TNY (any resolution)
*.TN1 (low resolution)
*.TN2 (medium resolution)
*.TN3 (high resolution)

Several people have reported sightings of mutated Tiny pictures that do not follow the standard format, so let's be careful out there. What is described here is the format that David Mumper's original TNYSTUFF.PRG produces.

1 byte resolution (same as NEO, but +3 indicates rotation information also follows)

If resolution > 2 {
1 byte left and right color animation limits. High 4 bits hold left (start) limit; low 4 bits hold right (end) limit
1 byte direction and speed of color animation (negative value indicates left, positive indicates right, absolute value

```
is delay in 1/60's of a second.
1 word color rotation duration (number of iterations)
}

16 words palette
1 word number of control bytes
1 word number of data words
3-10667 bytes control bytes
1-16000 words data words
-------------
42-32044 bytes total

Control byte meanings:

For a given control byte, x:

x < 0 Absolute value specifies the number of unique words to
take from the data section (from 1 to 127)
x = 0 1 word is taken from the control section which specifies
the number of times to repeat the next data word (from
128 to 32767)
x = 1 1 word is taken from the control section which specifies
the number of unique words to be taken from the data
section (from 128 - 32767)
x > 1 Specifies the number of times to repeat the next word
taken from the data section (from 2 to 127)

Format of expanded data:

The expanded data is not simply screen memory bitmap data; instead, the
data is divided into four sets of vertical columns. (This results in
better compression.) A column consists of one specific word taken
from each scan line, going from top to bottom. For example, column 1
consists of word 1 on scanline 1 followed by word 1 on scanline 2, etc.,
followed by word 1 on scanline 200.
The columns appear in the following order:

1st set contains columns 1, 5, 9, 13, ..., 69, 73, 77 in order
2nd set contains columns 2, 6, 10, 14, ..., 70, 74, 78 in order
3rd set contains columns 3, 7, 11, 15, ..., 71, 75, 79 in order
4th set contains columns 4, 8, 12, 16, ..., 72, 76, 80 in order

Note that Tiny partitions the screen this way regardless of resolution; i.e.,
these aren't bitplanes. For example, medium resoltion only has two bitplanes,
but Tiny still divides medium resolution pictures into four parts.

<Spectrum 512> *.SPU

80 words first scan line of picture (unused) -- should be zeroes
15920 words picture data (screen memory) for scan lines 1 through 199
9552 words 3 palettes for each scan line (the top scan line is
not included because Spectrum 512 can't display it)
-----------
```

51104 bytes total

Note that the Spectrum 512 mode's three palette changes per scan line allow more colors on the screen than normally possible, but a tremendous amount of CPU time is required to maintain the image.

A technical point: The first and second palette changes (bands of color) span 106 pixels each. The final palette change covers the remaining 107 pixels. (106 + 106 + 107 = 320 pixels)

<Spectrum 512 (Compressed)> *.SPC

1 word flag word [$5350 or "SP"]
1 word reserved for future use [always 0]
1 long length of data bit map
1 long length of color bit map
<= 32092 bytes compressed data bit map
<= 17910 bytes compressed color bit map

<= 50014 bytes total

Data compression:

Compression is via a modified run length encoding (RLE) scheme, similar to DEGAS compressed and Tiny. The data map is stored as a sequence of records. Each record consists of a header byte followed by one or more data bytes. The meaning of the header byte is as follows:

For a given header byte, x:

0 <= x <= 127 Use the next x + 1 bytes literally (no repetition)
-128 <= x <= -1 Use the next byte -x + 2 times

The data appears in the following order:

1. Picture data, bit plane 0, scan lines 1 - 199
2. Picture data, bit plane 1, scan lines 1 - 199
3. Picture data, bit plane 2, scan lines 1 - 199
4. Picture data, bit plane 3, scan lines 1 - 199

Decompression of data ends when 31840 data bytes have been used.

Color map compression:

Each 16-word palette is compressed separately. There are three palettes for each scan line (597 total). The color map is stored as a sequence of records. Each record starts with a 1-word bit vector which specifies which of the 16 palette entries are included in the data following the bit vector (1 = included, 0 = not included). If a palette entry is not included, it is assumed to be zero (black). The least significant bit of the bit vector refers to palette entry zero, while the most significant bit refers to palette entry 15. Bit 15 must be zero, since Spectrum 512 does not use palette entry 15. Bit 0 should also be zero, since Spectrum 512 always makes the background color black.

```
The words specifying the values for the palette entries indicated in
the bit vector follow the bit vector itself, in order (0 - 15).

<Art Director> *.ART (low resolution only)

16000 words picture data (screen memory)
16 words palette
15 * 16 words 15 more palettes for animation
-------------
32512 bytes total

<C.O.L.R. Object Editor Mural> *.MUR (low resolution only)

16000 words picture data (screen memory)
(palettes are stored in separate files)
-----------
32000 bytes total

<Doodle> *.DOO (high resolution only)

16000 words picture data (screen memory)
-----------
32000 bytes total

<Animatic Film> *.FLM (low resolution only)

1 word number of frames
16 words palette
1 word speed (0 - 99; value is 99 - # vblanks to delay between frames)
1 word direction (0 = forwards, 1 = backwards)
1 word end action (what to do after the last frame)
0 = pause, then repeat from beginning
1 = immediately repeat from beginning
2 = reverse (change direction)
1 word width of film in pixels
1 word height of film in pixels
1 word Animatic version number (major)
1 word Animatic version number (minor)
1 long magic number 27182818 (hex)
3 longs reserved for expansion (should be all zeros)
--------
32 words total for header

? words image data (words of screen memory) for each frame, in order

<GEM Bit Image> *.IMG

1 word version number of image file [1]
1 word length of header in words [usually 8]
1 word number of color planes [1 for monochrome]
1 word pattern length in bytes [1-8, usually 2 for screen images]
1 word pixel width in microns (1/1000 mm, 25400 microns per inch)
1 word pixel height in microns
1 word line width in pixels
```

1 word number of lines

? words header length defined in 2nd word of header

? bytes data

NOTES: If the image is a color image (planes > 1), the planes are stored separately starting with plane 0. There is, however, no standard way of storing the color palette. Some programs may save the palette in separate files, some may extend the header. For this reason, you should never assume the header is 8 words long, always get the header length from the 2nd word of the header. Also, the line width in the 7th word is the number of pixels in a line. Since the data is encoded in byte-wide packets, the actual unpacked line width is always a multiple of 8, and may be 1-7 pixels longer than the length specified in the header.

For each byte x in the data section,

x = 0 Pattern/scanline run.
Read the next byte, n (unsigned).

If n > 0 then:
Read a number of bytes equal to the "pattern length" word in the header. Repeat this pattern n times.

If n = 0 then:
Scanline run. Data for the next scanline is to be used multiple times. Read the following record:

1 byte flag byte [$FF]
1 byte number of times to use next scanline data

The data for the next scanline follows, compressed normally.

x = 80 (hex) Uncompressed bit string. The next byte determines the number of bytes to use literally. The literal data bytes follow.

otherwise Solid run. The value of x determines what to draw. The high bit specifies whether the pixels are set or cleared. A 1 indicates a byte-run using $FF, a 0 indicates a byte-run using $00. The low 7 bits, taken as an unsigned quantity, specify the length of the run in bytes.

<STAD> *.PAC (high resolution only)

4 bytes "pM86" (vertically packed) or "pM85" (horizontally packed)
1 byte id byte
1 byte pack byte (most frequently occuring byte in bitmap)

```
1 byte "special" byte
-------
7 bytes total for header

? bytes data

The data is encoded as follows. For each byte x in the data section:

x = id byte Read one more byte, n. Use pack byte
n + 1 times.
x = "special" byte Read two more bytes, d, and n (in order).
Use byte d n times.
otherwise Use byte x literally.

<Imagic Film/Picture> *.IC1 (low resolution)
*.IC2 (medium resolution)
*.IC3 (high resolution)

4 bytes "IMDC"
1 word resolution (0 = low res, 1 = medium res, 2 = high res)
16 words palette
1 word date (GEMDOS format)
1 word time (GEMDOS format)
8 bytes name of base picture file (for delta compression), or zeroes
1 word length of data (?)
1 long registration number
8 bytes reserved
1 byte compressed? (0 = no, 1 = yes)

If compressed {
1 byte delta-compressed? (-1 = no, > -1 = yes)
1 byte ?
1 byte escape byte
}
-------
65 bytes total for header (68 bytes if compressed)

? bytes data

Compressed data may be either stand-alone or delta-compressed (relative
to the base picture named in the header). Delta compression involves
storing only how the picture differs from the base picture (i.e., only
portions of the screen that have changed are stored). This is used to
to encode animated sequences efficiently.

Compressed data, stand-alone:

For each byte x in the data section:

x = escape byte Read one more byte, n. (n is unsigned).

If n >= 2, use the next byte n times.
If n = 1, keep reading bytes until a
byte k not equal to 1 is encountered.
```

```
Then read the next byte d.
If the number of 1 bytes encountered is o,
use d (256 * o + k) times. I.e.,

if (n == 1) {
o = 0;
while (n == 1) {
o++;
n = next byte;
}

k = n;
d = next byte;

Use d (256 * o + k) times.
}
else {
d = next byte;
Use d (n) times.
}

x != escape byte Use x literally.

Compressed data, delta compressed:

For each byte x in the data section:

x = escape byte Read one more byte, n. (n is unsigned).

If n >= 3, use the next byte n times.
If n = 1, do the same as for n = 1 in
stand-alone compression (above).
If n = 2, then set n = next byte.
If n = 0, end of picture.
If n >= 2, take n bytes from base
picture.
If n = 1, do the same as for n = 1
in stand-alone compression (above),
but take (256 * o + k) bytes from
base picture.

x != escape byte Use x literally.

<IFF Format> *.IFF

4 bytes "FORM" (FORM chunk ID)
1 long length of file that follows
4 bytes "ILBM" (InterLeaved BitMap file ID)

4 bytes "BMHD" (BitMap HeaDer chunk ID)
1 long length of chunk [20]
20 bytes 1 word = image width in pixels
1 word = image height in lines
1 word = image x-offset [usually 0]
```

```
1 word = image y-offset [usually 0]
1 byte = # bitplanes
1 byte = mask (0=no, 1=impl., 2=transparent, 3=lasso)
1 byte = compressed [1] or uncompressed [0]
1 byte = unused [0]
1 word = transparent color (for mask=2)
1 byte = x-aspect [5=640x200, 10=320x200/640x400, 20=320x400]
1 byte = y-aspect [11]
1 word = page width (usually the same as image width)
1 word = page height (usually the same as image height)

4 bytes "CMAP" (ColorMAP chunk ID)
1 long length of chunk [3*n where n is the # colors]
3n bytes 3 bytes per RGB color. Each color value is a byte
and the actual color value is left-justified in the
byte such that the most significant bit of the value
is the MSB of the byte. (ie. a color value of 15 ($0F)
is stored as $F0) The bytes are stored in R,G,B order.

4 bytes "CRNG" (Color RaNGe chunk ID)
1 long length of chunk [8]
8 bytes 1 word = reserved [0]
1 word = animation speed (16384 = 60 steps per second)
1 word = active [1] or inactive [0]
1 byte = left/lower color animation limit
1 byte = right/upper color animation limit

4 bytes "CAMG" (Commodore AMiGa viewport mode chunk ID)
1 long length of chunk [4]
1 long viewport mode bits (bit 11 = HAM, bit 3 = interlaced)

4 bytes "BODY" (BODY chunk ID)
1 long length of chunk [# bytes of image data that follow]
? bytes actual image data

NOTES: Some of these chunks may not be present in every IFF file, and may
not be in this order. You should always look for the ID bytes to find a
certain chunk. All chunk IDs are followed by a long value that tells the
size of the chunk. This is the number of bytes that FOLLOW the 4 ID bytes
and size longword. The exception to this is the FORM chunk. The size
longword that follows the FORM ID is the size of the remainder of the file.
The FORM chunk must always be the first chunk in an IFF file.

The R,G,B ranges of AMIGA and ST are different (AMIGA 0...15, ST 0...7),
as is the maximum number of bitplanes (AMIGA: 5, ST: 4).

Format of body data

An expanded picture is simply a bitmap. The packing method is PackBits
(see below), and is identical to MacPaint and DEGAS Elite compressed.

The (decompressed) body data appears in the following order:
```

```
line 1 plane 0 ... line 1 plane 1 ... ... line 1 plane m
[line 1 mask (if appropriate)]
line 2 plane 0 ... line 2 plane 1 ... ... line 2 plane m
[line 2 mask (if appropriate)]
...
line x plane 0 ... line x plane 1 ... ... line x plane m
[line x mask (if appropriate)]
```

The FORM chunk identifies the type of data:

```
"ILBM" = interleaved bit map
"8SVX" = 8-bit sample voice
"SMUS" = simple music score
"FTXT" = formatted text (Amiga)
```

<MacPaint> *.MAC

```
1 long version number [0=ignore header, 2=header valid]
38 * 8 bytes 8x8 brush/fill patterns. Each byte is a pattern row,
and the bytes map the pattern rows top to bottom. The
patterns are stored in the order they appear at the bottom
of the MacPaint screen top to bottom, left to right.
204 bytes unused
-------------
512 bytes total for header

< 51200 bytes compressed bitmap data
-------------
< 51712 bytes total
```

NOTE: The version number is actually a flag to MacPaint to indicate if the brush/fill patterns are present in the file. If the version is 0, the default patterns are used. Therefore you can simply save a MacPaint file by writing a blank header (512 $00 bytes), followed by the packed image data.

Bitmap compression:

The bitmap data is for a 576 pixel by 720 pixel monochrome image. The packing method is PackBits (see below). There are 72 bytes per scan line. Each bit represents one pixel; 0 = white, 1 = black.

<PackBits Compression Algorithm>

The following packing algorithm originated on the Mac, was adopted by Electronic Arts/Commodore for use in the IFF standard, and then by Tom Hudson for use in DEGAS Elite. The algorithm is currently used in MacPaint, IFF, and DEGAS Elite compressed file formats. Each scan line is packed separately, and packing never extends beyond a scan line.

For a given control byte 'n':
0 <= n <= 127 : use the next n + 1 bytes literally (no repetition).
-127 <= n <= -1 : use the next byte -n + 1 times.
n = -128 : no operation, not used.

---

* Roland Waldi contributed extensive information on the following formats:

GEM, IMG, Doodle, STAD, Imagic Film/Picture, Art Director, IFF

** John Brochu, ST picture formats guru, provided sage advice and many corrections to the following formats:

NeoChrome, DEGAS Elite Compressed, Spectrum 512 Compressed,
GEM Bit Image, IFF, MacPaint

Hello, I heard that atari had a laptop and was wondering if you guys could email me information on it.

I am looking at laptops, and was wondering what the price (usa) is (are there ed discounts too?), its weight, screen, etc.

I might be wrong, perhaps it is just a portable I dunno.

Anyway, thankyou in advance!

Source record: 236515

> Arrrgh! I think Michtron went out of business, and I have not gotten a

I read in either ST-Report or ZNET (can't remember which) that MichTron
was bought and moved to the east coast. They have promised to continue
support of the old line of products and their distribution/importation
of European software.

They requested that any support questions, etc. be in writing to the
new address for the next couple of months due to the move.

Astounding Fact(?) from CompuServe magazine: There are several SHAREWARE
companies that have made more than one million dollars. I found this
very suprising and though others might be interested.

Message-ID: <10540@ucrmath.ucr.edu>
Source record: 236516

Hi,
I recently bought a hard drive, and believe that I may have blown one of the chips. The symptoms are that, when turned on the drive clicks once, but does not spin, and one chip on the back gets extremely hot. The drive is a Seagate st-157n. Does this sound like a problem with a chip? or is there another likely answer? Also, if it is the chip, does anyone know how easy it would be to get a replacement controller and roughly how much it might cost? I would simply take it to the repair center on campus, but they charge $50 an hour, which I am a bit loathe to pay.....

Anyways, any respnses would be greatly appreciated.

4005. PostScript for 9pin-, 24pin & Laser printers

Newsgroup: comp.sys.atari.st
Date: 1990-12-12 09:30:20 UTC
From: glazou@mowitz.pdc.kth.se
Message-ID: <GLAZOU.90Dec12103005@mowitz.pdc.kth.se>
Source record: 236517

Strange... I don't think someone on the net but french ST-users know
this product :

GRAPHIX by Procyon (somewhere in the east of France) is a fully
implemented PostScript language.

It can use PS fonts AND Gdos Fonts. In that case, Gdos fonts can only
be 'turned' by 90 degrees steps (are you also waiting for the new Gdos allowing
to use vectorial fonts ? Zeus, I'd like to see that...)

It includes a screen previewer, source editor, demos sources and a lot
of printers drivers. It can even produce a *.GEM file you can export to Calamus,
Easy-Draw or *any* program using this format...

I use this stuff with my old and good Epson LQ-500 and the result is
wonderful... It works without any problem with only 1 Meg of memory, Hard Disk
is useful but not necessary, monochrome monitors only.

AND it is much cheaper than ULTRA*CRIPT...

Info about this package have been published some time ago in the french
review "ST-Mag".

4008. Atari 1040ST system for sale

Newsgroup: comp.sys.atari.st
Date: 1990-12-12 12:24:17 UTC
From: kenyee@ksr.com
Message-ID: <1417@ksr.com>
Source record: 236521
Cross-posted to: misc.forsale.computers,ne.forsale,comp.sys.atari.st

For Sale:

Atari 1040ST w/internal DS 3 1/2" drive and mouse
Atari SC1224 color monitor (controls are on the front)
5 1/4" hard drive kit(everything you need except for a SCSI drive):
15" x 5.5" x 7" metal case
fits 2 1/2 height drives or 1 full height
60W power supply and fan, 18" SCSI cable, and 3' DMA cable
ICD ST Host adapter w/built-in clock/calendar
(allows daisy chaining of the DMA port)
ICD hard disk caching software
ICD disk Cleanup program
Diamond Back II backup program
Prometheus Promodem, 1200 baud external w/ RS232 cable
2 Wico joysticks
software: PC Ditto I software emulator, Easy Draw w/ Supercharger,
Michtron Utilities, Procopy, Psion Chess, LDW Power spreadsheet,
Wayne Gretzky Hockey, Star Trek: The Rebel Universe, Heroes of
the Lance, etc.
books: Atari ST Internals, Atari ST GEM Programmer's Reference,
Compute's Technical Reference Guide: VDI

I would like to sell the complete system for $800, but if you're
interested in only some of these items, make me an offer.

4009. SRC for LZH??

Newsgroup: comp.sys.atari.st
Date: 1990-12-12 12:47:09 UTC
From: longj@lonex.radc.af.mil
Message-ID: <1990Dec12.124709.1173@lonex.radc.af.mil>
Source record: 236542

With the increasing use of LZH arced files, I find myself wishing I had a version on my machines here at work, just like I have versions of ARC and ZOO on them.

So....does anyone know where I could get the source for a simple, command-line version of unlzh that will compile on a SUN Sparcstation??

Lantech Systems
PO Box R
Billerica, MA 01821
(508) 667-9191

My church has been using Lantech for about 5 months to network 2 Mega 2s together. At first each Mega had a hard drive, but since the net has been working so well we took one of the drives off. Now we have a Mega 2 with a 85meg Toadfile as the host and a Mega 2 as a stand alone in another office. Lantech also includes a neat little desk accessory that allows you to use any printer on any node on the net. Works great for sending messages ;-) and there is also an e-mail utility.

I am not connected with Lantech. I am just a happy customer.

4016. Re: tos 1.6 & 1040st

Newsgroup: comp.sys.atari.st
Date: 1990-12-12 15:40:44 UTC
From: jeffk@sgi.com
Message-ID: <1990Dec12.154044.17293@odin.corp.sgi.com>
Source record: 236527

Why would you want to use TOS 1.6 on a regular 1040ST? The only difference between TOS1.4 and TOS1.6 is that 1.6 supports the additional hardware of the STEs.

If you were thinking of adding some kind of accelerator board (like the Turbo-030, Gadgets 030), they will come with a modified TOS1.6 that essentially strips out the code that addresses the additional hardware that only exists on STEs.

Regards,

Jeff Komori jeffk@sgi.com

4017. Re: Spectre and hard disks

Newsgroup: comp.sys.atari.st
Date: 1990-12-12 16:02:36 UTC
From: dlm@druco.ATT.COM
Message-ID: <6955@drutx.ATT.COM>
Source record: 236528

in article <1990Dec11.171531.7192@csun.edu>,
cacsc083@mx.csun.edu (Paul Wick) says:
> Note that the older format Mac scheme of Spectre 2.65 and below has a
> maximum `disk' (Mac didn't really have partitions then) size of 32 Mbytes.
> Spectre 3.0 uses a format that allows Mac partitions of 256Mbytes.

The 32 meg and 256 meg limits on partition sizes are actually
limits of the Spectre formatter. Spectre supports much larger partitions,
as long as the disk is formatted on a Mac.

Macs have always supported hard disk partitions. But when
the original partition system was developed there was no reason to
partition a Mac disk since nothing existed to use other partition types
(no Unix(tm), etc.).

Source record: 236541

Multimedia for the ST

The Apple Macintosh has had multi-media software available for quite some time in the form of Hypercard. Multi-media is a form of communication where audio and video are combined.

COMDEX '90 saw the introduction of Hyperlink by JMG Software. Hyperlink makes available the audio and video resources of the ST in one package. We have invited George Geczy, author of Hyperlink, to display his product at the January meeting of the Atari Users Group of Brantford. He will display this product as well as talk about multi-media in general.

If you have any questions, this is an ideal opportunity to see this exciting new development for the Atari ST.

January 9, 1991. 7:30pm. Junior Achievement Centre,
197 Colborne St, Brantford, Ontario
Admission is $5. You get a newsletter and when you bring a blank disk, you will receive a disk with PD software.

Please post this message on any BBS where there are ST users. Thank you.

Cross-posted to: comp.periphs.printers,comp.sys.atari.st

Ray Depew sez:

(about a problem I'm having getting underlines in the proper place on
a DeskJet 500, it looks more like a strike through of the next line. 8-)

> Your DeskJet should be set to print at a pitch of 6 lines per inch.
> Anything more dense than 6 lpi will cause just the problem you describe --
> also problems with descenders (the thingies hanging on the bottom of
> letters like "g" and "j") running into capital letters on the next line.

Thanks Ray, I think it is either broken, or my init string is bad, I'd
bet on the init string 8-).

By the way,
(NOTE: RETRACTION:) I was misinformed about the second DeskJet 500, it
is working fine.

Only my brother-in-law's machine is giving <him and me> trouble.

Oh yeah, all you Atari ST people, get the DJ utilities that are
available at the U Mich archive and/or the mail server for c.b.a.s.,
OR, fire up the DeskJet first, the 500 still stops the ST parallel
port from working if you turn it on after the ST.

cheers,

Bob Pegram

>Computer Eyes I think is the best, or at least, the most popular.
>(We all know that most popular doesn't mean the best. :^) It only
>digitizes in 16 colors, but read on....

I have color computer eyes.

First I would like to say that the company that makes color computer eyes is one of the best I have EVER had to deal with. They have MY highest recommendations.

Color computer eyes scans a signal and produces RGB data.
The ST low res normally supports 16 colors-- thus the normal image shown with color computer eyes has 16 colors.

Now, you can do anything you want with the RGB data and one program out will use this data to make a Spectrum picture. With this addition, I find the images quite acceptable.

The resolution for these images is 320 pixels by 200 pixels.
When these images are viewed on a Sun, for example, with its 1152x900 pixel screen-- the image looks rather small.

There are various ways to provide a signal for color computer eyes: I tend to use a digital vcr with STOP frame. Even without a tape in the mechanism, I can press a button and freeze the image on the screen. This image is perfectly still. I find that the scanned image will be almost identical (sometimes the TVs color settings are slightly off.)

Next, I have used a color camera (I don't have details), but I find that the LIGHT used makes a world of a difference. I find that the best images are scanned DIRECTLY from the camera with a BLUE light. These images are quite sharp and they are exactly what I was looking for when I purchased the video digitizer.

Send me email if you want to talk more...

4038. Bibtex bug

Newsgroup: comp.sys.atari.st
Date: 1990-12-12 23:07:01 UTC
From: david@doe.utoronto.ca
Message-ID: <1990Dec12.230701.1551@doe.utoronto.ca>
Source record: 236548

There was a small bug in the bibtex program in bibtex.lzh, part of
the TeX 3.1/Metafont 2.7 ST port by Frank Ridderbusch, which I recently
sent in to atari.archive. I have sent them a replacement bibtex.lzh.
If you have the old one, please wait a couple of days, then order it
again. The rest of the distribution seems OK.

4039. Re: Kill files in rn....

Newsgroup: comp.sys.atari.st
Date: 1990-12-12 23:15:48 UTC
From: ljdickey@watserv1.waterloo.edu
Message-ID: <1990Dec12.231548.2198@watserv1.waterloo.edu>
Source record: 236549

In article <1863@beguine.UUCP> John.Bunch@samba.acs.unc.edu (John Bunch) writes:
>Hello, I would like to know if it is possible to set up a kill file to
>ignore message from specific people? Please respond via email.

I have responded to John via e-mail, but I am sure that there are others
who would like to raise the tone of this news group, and one way to
do that is to filter out the static. My theory is that if nobody
answers the unpleasant message writers, they they will just go away.

So I will tell you what I have found to be useful.

While reading the news for a specific group, type CTRL K (to
edit the Kill file for that group), and add a line like

/boo_hiss@machine.site.xxx/h:j

to the file. This has the effect (on my system) of marking as
read, any message that has that string in the header. In
particular, any messages from "boo_hiss" is marked as read.
When I am tired of reading the counter- flames that refer to
"boo_hiss", I add the line

/boo_hiss@machine.site.xxx/a:j

and then any message that contains this string anywhere in the
message is marked as read.

I post this with the hope that some folks who might otherwise be discouraged
will persevere just a bit longer. On the whole, this group has been a big
help to me, and I hope it can be for others too.

I like it when folks are helpful to each other.
I hate it when folks make nasty jabs.

4041. TOS file system consistency check - is there one?

Newsgroup: comp.sys.atari.st
Date: 1990-12-13 03:49:50 UTC
From: rcb@netcom.UUCP
Message-ID: <18671@netcom.UUCP>
Source record: 236451

I have AHDI 3.01 on my hard disk. Being familiar with DOS and its 'chkdsk' command as well, I'm wondering if there is any equivalent for AHDI 3.01. I never have any problems with it, so this is just curiosity speaking. Does AHDI do a consistency check on boot-up or as it goes along? Hmmm, what if there were no check?! (a rhetorical question!)

4042. RZ/SZ - latest version?

Newsgroup: comp.sys.atari.st
Date: 1990-12-13 04:09:36 UTC
From: rcb@netcom.UUCP
Message-ID: <18674@netcom.UUCP>
Source record: 236452

I retrieved a port of RZ and SZ done by CWRU ST enthusiasts (Bammi and company, no doubt) from atari.archive. It says it is version 1.67, based on Chuck Forsberg's version 2.12 of SZ and version 2.03 of RZ. I am wondering if there are any newer versions around.

My motivation for asking was that I would like to be able to upload files without waiting for an ACK to come back from the receiving end (i.e. in a continuous stream). I've already tried out Alan Hamilton's excellent XYZ, which does this. I would feel more comfortable working with something derived from the original, though. Another (more tangible) advantage of the original is Z-modem compression.

So, Jwahar or anyone out there, has Forsberg's RZ/SZ version 3.xx been ported yet? In case anyone is wondering (Derek?), I do plan to send $10 to Alan Hamilton for XYZ (just because he obviously put a lot of effort to make a robust program). Anyway, thanks ...

>the best.

Perhaps most would agree, but I don't agree at all. If you want the best, get the Berkeley Microsystems BMS-200 host adapter. Nothing else touches it in terms of getting the signals and timing right.

ICD may be much more widely available, but that doesn't make it the best.

>I'd love to fit it too.

So that implies that the six-chip TOS set is on 64Kbit ROMS. When I opened my machine last time, I noticed that there was a connection on the motherboard that had to be soldered/desoldered (I forget which) to enable the ST to use 256Kbit ROMS, don't all ST's have this capability? The only problem I see about putting the TT ROMs in an ST is that they access hardware not available on the ST. Another problem might be that there is 68030 code in the ROMs, but if they can be plopped into an STE, that can't be a problem. I'm just guessing here, but I bet that there is some code in the ROMS (at least the older ones) that is non-tuned high-level language compiler output, otherwise we wouldn't have products like QuickSTII that blow the doors off of the speed of the ROMs themselves. Maybe tuning the routines would save space as well as speed things up. Anyway, I don't believe in fixing things that work, so I won't be replacing my TOS 1.4 ROMs unless there is extra functionality, more speed, and compatibility with existing software. When I put TOS1.4 in, some software (Arkanoid is all that I can think of right now) wouldn't work anymore. Despite people like Allan Pratt that (rightfully) try to stop people from taking shortcuts around documented TOS features, there will always be some poorly written software that doesn't work with a newer TOS version, so check your software out before you upgrade! I only upgraded to 1.4 because of its better hard disk management.

The best way to obtain SpiritWare's concordance program is to contact SpiritWare directly at Fifteenth Avenue Bible Church, 15211 15th Avenue N.E., Seattle, Washington 98155. While the New Testament with program may fit on on 720k diskette, the full KJV fills four. If, at any point, you have to download at 1200 or 2400 baud, you will die of old age before the files are complete. :)

In any case, you really do want the support that they offer. A decent manual is worth many times its weight in whatever precious metals you can dream of. And if you want to automatically receive the latest version, SpiritWare needs to know that you exist.

Terry Reeves

My only association with SLAC and Stanford Univ is as a user/visiting scholar, and as such, any opinions expressed by me are not to be thought of as having anything to do with the official policies of SLAC or Stanford Univ.

|> So you have to buy it.

For I am working with a German bible it would be really interesting for me
if I could use the concordance program with a German text. Is it possible
to feed it the ASCII version of a German bible, perhaps run some
initialization across it, and than work with it just as with the King James
Bible?

4048. TT Desktops & Company policy

Newsgroup: comp.sys.atari.st
Date: 1990-12-13 09:42:23 UTC
From: neil@cs.hw.ac.uk
Message-ID: <5217@brahma.cs.hw.ac.uk>
Source record: 236455

Like others here I saw the review of the new TT desktop in ST World too.
The review was a pile of sh*t but the new desktop looks real fine. I want
it, but a whole TT is too high a price to pay to get it.
If it can't fit in the 192K ST ROMs, OK, just release it in RAM.

The computer press reporting on this issue is very confusing:-
Computer Shopper quoted an unamed Atari spokesman saying that next year
Atari will raise the base level of the OS.
ST (Virus) User, in talking about the pirate copies, said that Atari has
no intentions of releasing the desktop for existing ST owners. To do so
would compete with third party companies producing alternative desktops.

I found some old disks the other day which dated from when we were evaluating
the ST (No internal floppy, TOS 0.00). One of the disks had a TOS version
even older than 1.00! It was in two parts:- TOS.IMG had only the GEMDOS and
BIOS while COMMAND.PRG had the VDI,AES and GEM desktop. A crude, MS-DOS style,
command line interpreter was also included as an alternative to the GEM part.
(For the version spotters: GEM Desktop v3.09, AES 0001, GEMDOS 0400, TOS 0020)
The real fun thing was running the GEM part on top of TOS 1.4's GEMDOS and
BIOS. This was done by using a boot sector that did not load TOS.IMG but just
sets the _cmdload flag at $482 so that COMMAND.PRG gets loaded after the AUTO
folder has finished. OK the result is dumb. You downgrade GEM.
But why does atari not release the new TT system for ST's in this way?
Makes a bundle of sense to me! (and you, gentle reader :-)
Just think of what the GEMDOS and BIOS would be like if it had the 192K
all to itself!

I guess it's just a pipe dream. Atari's policy seems to be:- Take a good look
at what others manufacturers do that makes them so popular, listen closely to
the opinions of users and programmers then do 'something completely different'.
Would it help if we all wrote letters to Jack Tramiel?

eg.

What *I* think Atari should do:-

* Really start marketing the ST as a business machine not as a games
machine.

* Lose the keyboard styled machines in favour of the Mega style.
Make the TT case just a big Mega one. Megas look real neat!

* Fix the STacy's battery power problems.

* Advertise heavily in the business computer press.
(Have you seen the poor quality of ST mags around here!)

* Get the Big Boys interested in producing applications for the ST/TT.
(Where Big Boys = Lotus, Ashton Tate, Microsoft, Aldus, Borland etc)

* Upgrade the GEM/TOS regularly. Perhaps Microsoft would port Windows
to the ST/TT as a layer similar to the one above.

* Produce new SHIFTER, GLUE and MMU chips to give old ST's as much
STE/TT capabilities as possible within the limits of pin
compatibility. Improve the base level!

I could add lots of other things to that list but they all that seems to be
rather obvious to me. If Atari could pull that off they'd be set.
I remember Jack grumbling when here came to Europe to promote the PC clone
line. "They should be buying ST's" he said. Well go and boot the asses of your
marketing men and maybe people will!

This months ST Applications (ST Club) magazine has a review of the new TT desktop (What else! :-). It's a weird review! The screen shots of the dialogs have some text in English and some in German. In the same dialog! The English in the dialogs does not match that seen in the ST World review (see other posting). Is this the latest in Atari bi-lingual TOS ROM versions? Somehow I think not. It is probably a pirate copy that has been 'translated' rather poorly from the German version.

Hyper Format by A german chap that gets on here "Brod" is i think part
of his name, Please excuse not knowing it, but his Formater works very
well, and has the Option to Verify, and will do PC Formats, and 11
sector formats, and this one works !, but don't know if it has the
3 sector FAT option, as the Atari uses a none standard 5 sector format
this can play havock with PC's, The Program Name that i have is
HYPFM320.PRG, i don't know if there is a later one, also this Program
will do 1.1 Meg and 1.2 meg Formats, with Hardware Mods, this i don't
have the details on, but from what i gather, you speed up the clock
to the controller ic..

>is for use with lint really. So, is the actual Lint available on the ST? If
>not, can anyone get the source, so I could maybe port it over.

i have never seen a PD lint (so far). most lints i have seen are based on
pcc (and share source with it). these are generally copyright ATT or of
a particular vendor (e.g. convex). there are commercial lints available
on MSDOS.

varlint is a program to check printf statements only, as i recall (for
variable arg routines).

if you happen across a truly PD lint, pls post it. i suspect you will
not, however. if you are really hot to trot for lint, you could start
with a PD compiler (sozobon, gcc, etc) and reverse engineer it from a
manpage. if you want to attempt this, think of a good way to implement
lint libraries (llib_* or whatever).

happy hunting...

Well i do have a Atari phamplet on the STE, and is does State that the
RAM: internally expandable to 4 Mb; This would be one reson that i would
purchase a STE, SIMMS here in NZ. are $90 NZ per Meg: but the cost of a
2/4 Meg STE , is far to high, NOTE: a 1040 STE plus Colour Monitor plus
30 Meg Hard Disk, comes to $3900 NZ, you can bye a Teco 386SX with
40 meg hard disk,1 meg ram and VGA with VGA monitor for $2900 NZ, i
don't se the 'TT' will ever get a look in here...

>a file and code that showed how to adjust the mono resource file by halving
>the vertical dimensions of objects, but now I can't find it.
> Can someone help me find this info?

the quick answer may be to consider making more trees rather than
trying to cram everything on one screen.

the long answer is to look at rsrc_obfix AES call. this converts from
character coords (what res construction set puts out) to pixel coords.
i believe this takes resolution into account. i also believe this may
be done by rsrc_load automatically.

what u need to do is something like this for each tree (assuming resource
was built in high res):

```
int res;
OBJECT *obj;
int xnewlo[NUMOBJ],ynewlo[NUMOBJ],ynewmed[NUMOBJ];

rsrc_load ("MYAPP.RSC");
res = Getrez ();

for (i=0; i<NUMOBJ; i++)
{
rsrc_gaddr (R_TREE, i, &obj);
switch (res)
{
case LO:
obj[i].ob_x = xnewlo[i];
obj[i].ob_y = ynewlo[i];
break;
case MED:
obj[i].ob_y = ynewmed[i];
break;
}
}
```

this assumes the object can stay the same size, just move locations
before you draw the obj. make the table ahead of time, noting that
obj coords are relative to the PARENT not the SCREEN. objc_xywh
gets the screen coords. you can get the parent from ob_next/head/tail
things and walking top down. i don't believe you can do just:

```
obj[i].ob_y /= 2;

or

obj[i].ob_y >>= 1;
```

if you have a resource editor which can dump C source, do so. you can manually load it yourself then you don't need ANY .rsc file.

if you really need to change the size of the objects (like icons) you need to replace things like ob_spec (which is a ptr to the ICONBLK struct, for example. generally strings, tedinfos, buttons, etc are ok. it is icons that pose the biggest problem. another trick to try is to build sets of icons on each resolution, then hard code them into your code, switching the ptr in ob_spec as above.

decent GEM references (if u can still find them) are:

Pollack and Weber, ATARI ST Application Programming, Bantam, 1987

Balma and Fitler, Programmer's Guide to GEM, Sybex

ATARI ST Gem Programmer's Reference, Abacus

the abacus books (at least the early editions) occasionally are buggy but not in this area, as i recall. you can also get the "official" docs from atari by becomming a bona fide developer. the atari docs are probably the most complete, but are references, and generally do not tell how to use things like the books do. i learned most from the Sybex book (it is the oldest) but later found pollack and weber to be about the best single volume reference on AES/VDI/GEMDOS/BIOS/XBIOS. numerous examples with source. i also think it is out of print. also: practice makes perfect :-)

this is for memory, and i have not written AES/VDI code in quite some time. i do have a custom file selector (with drive buttons) i wrote years ago which does this sort of thing if you still have problems. it is self contained in that it sets up a complete object tree in C and contains no .rsc file. you should also try and find the PROGEM tutorial series by tim oren (ex-DRI guy who co-authored parts of GEM). it is quite good. i believe it can be found on terminator.

you may want to consider posting a request like this to c.s.a.st.tech since more weenies probably read that than this newsgroup, depending on the level of insanity of this group at any particular point in time :-) actually, this is a refreshing subject for a change. better than a zillion articles on memory upgrades (which only are of interest to me when someone starts talking 8 MB :-)...

>
Well, the same goes with the regular 520stfm's here. My friend just bought a 520stfm and lo and behold when you open the case, there's a 1040 board with 1/2 a meg of memory on it and the holes where the other 1/2 meg would be are filled with solder. So, all that is needed is to desolder the holes, plug in the other 1/2 meg, and change a little solder bridge that lets the machine access the memory and there you go, for about $30-$40 (generally):-) you have a 1040stfm. I guess Atari doesn't make 520 boards any more.
--Someone is really making out on the deal when people buy a 1040 for much more.

Good thinking, my management book here at college already has a few paragraphs about Jack Tramiel as an example of bad management. (This is from when he was with Commodore, but nothing seems to have changed.) :-(

> a site in Finland, and had nothing to do with the upgrade (just a happy
> user!).

I have been using ELVIS for some time from gulam and msh. You have to
be sure that the environment variables: TEMP TERM and TERMCAP are set.
for TMP I use n:\tmp. For TERM I use vt52. ELVIS seems to ignore the
TERMCAP entry but it still needs to be set in order to work. I use
c:\bin\termcap. BTW: c:\bin\termcap does not exist.
Last night I pulled down the sources for ELVIS 4.0 from alt.sources and
compiled them last night using MWC it it also works fine. However, the
new ELVIS comes with some other programs (wildcard.ttp and some others)
that need to be present in the search path.

Later, Paul Moreau.

>few programs now and again, but otherwise is totally useless.

"The Sorcerer" is right in respect to CAD software -- you would not be
able to live with PC-Ditto (the software emulator) as it would be waaay
too slow for that type of application.

However, for other programs such as the Quicken financial package,
PC-Ditto (while not blazingly fast) gives acceptable performance IMHO.
The other neat things about 'Ditto are that it is CHEAP and SOLID. I
have yet to to find a non-game IBM program that won't run under it
including SuperProject Expert and ABT's Project Workbench (both of which
retail at or over $1000). I have even run GEM/3 desktop (slowly) but
did have some trouble getting the mouse to operate correctly. (In this
case it appeared that the mouse could not be "sampled" often enough to
provide a "real-time" response to the user.)

I have a huge collection of STart magazine dating back to Winter '86 through the latest issue. I have sold my ST and no longer have a use for the magazines. Here's the deal:

STart Magazine Winter '86 to Present with disk for most issues.

I will also send any additional issues that I receive (through March '91). Also there are 3 or 4 issues missing (my mailman ate them).

All this for $50 + shipping (or best offer)

Source record: 236487

Hello. A friend of mine bought STOS some time ago, and has since then
upgraded his atari to TOS 1.4. This initiated a series of problems;
most things crashes
mouse does definitely not work.
He sent in his registration card, but never got any answer so he don't
know whether there exists a fix (upgrade) for this or not.
SO, if anybody out there know of a binary fix, or anything, could you
please mail me a note of the availability, or better yet, send the
fix.
If so, I guess I know what I can give my friend for christmas :-)

Erling Henanger.

Message-ID: <1990Dec13.184200.16946@wpi.WPI.EDU>
Source record: 236491

Seasons Greetings World!
I've just recieved (free I might add) a demo
software disc from Yamaha. The disc contains 128 new
sounds for my recently purchased TG-55 rack mount tone
generator/sample player. My only problem is the format.
The disc is from what I understand an MS-DOS based system.
Is there anyone who would be willing to transfer
this to a 1040ST disc so that I can use it on my ST?
I thought I could load it as a MIDI file but it isn't
working. Any help or replies are appreciated.
Thanks,
Doug White

on atari.archive certainly, if they can be made easy to find.

on c.s.a.st IFF the header contains a keyword (REVIEW ??)so the review can be
avoided by those not interested.

_Note_versions_prominently_ - perhaps have separate reviews of major upgrades
or less buggy predecessors.

why limit ourselves to atari.archive stuff? I would like to see
reviews (and feedback) about most ST programs

Just my $ 0.02, and I would be willing to contribute a review once in while.

>Does FORMAT.{PRG,ACC} (posted to atari.archive, I believe) VERIFY the
>format?

I don't know about this one, but I posted my formatter to
comp.[sources binaries].atari.st, which formats 10 track, 80 sector
disks and verifies them. It runs as a program or accessory, and
writes 800K disks such that single sided drives can read 400K of that.

It's called DUBL_VIS.PRG and it should be on the archives, I suspect.
It doesn't have any interesting options like ms-dos boot sector or
sector skewing, but someone could add that if they liked...

It doesn't do any weird tricks and has been completely reliable in my
experience.

Date: 1990-12-13 19:32:07 UTC
From: selick@bucsf.bu.edu
Message-ID: <70662@bu.edu.bu.edu>
Source record: 236492

I have a 1040ste that I bought mainly to run music (midi) applications. I find it surprising that none of the discussions on this message base seem to revolve around midi, considering that the ports are built right into the machine. I have Notator, xor, and the following synths:

Yamaha:TG-55, SY-22, DX-7(original, tx-16w(sampler)
Alesis:quadraverb, hr-16b
art: multiverb ext
korg: ex-800 (for sale...)

I would love to start trading sounds that I have made, and other pd sounds with other users of these machines. Also, midi songs would be great too.

Keep on rocking in the free world

My, what selective memories we have here! Alan Pratt had to
pubicly eat his words about nonexpandability of STEs right in this newsgroup,
so the next quote is supposed to be correct. Of course, Atari could
change its mind, or goof sometimes. BTW, STEs only use SIMMS or SIPPS,
which are as removable as SIMMS, when not soldered in 8-).

4073. Administrative: New feature in comp.sources and comp.binaries.atari.st

Newsgroup: comp.sys.atari.st
Date: 1990-12-14 00:02:11 UTC
From: koreth@panarthea.EBay.Sun.COM
Message-ID: <677@grapevine.EBay.Sun.COM>
Source record: 236382
Cross-posted to: comp.sys.atari.st,comp.binaries.atari.st,comp.sources.atari.st

Comp.sources.atari.st and comp.binaries.atari.st postings of more than one part now have References: lines, so that thread-following newsreaders such as trn and nn can easily select all the parts of a particular program.

" !" - Marcel Marceau
Steven Grimm Moderator, comp.{sources,binaries}.atari.st

4074. v13INF1: Introduction to comp.binaries.atari.st

Newsgroup: comp.sys.atari.st
Date: 1990-12-14 00:16:27 UTC
From: koreth@panarthea.ebay.sun.com
Message-ID: <678@grapevine.EBay.Sun.COM>
Source record: 236352
Cross-posted to: comp.binaries.atari.st,comp.sys.atari.st

```
Submitted-by: koreth@panarthea.ebay.sun.com (Steven Grimm)
Posting-number: Volume 13, Info 1
Archive-name: intro

This is the first of three introductory articles about comp.binaries.atari.st.
This one describes how to submit binaries to the newsgroup. A companion
article lists all previously-published binaries, and a third article explains
how to retrieve and unpack binaries posted by others.

I am always looking for suggestions on how to improve the usefulness
of the newsgroup, and can be contacted as listed below.

-- Steven Grimm
koreth@panarthea.ebay.sun.com

--------------------

Subject: Submitting binaries for publication

Items intended for posting or queries and problem notes should be sent to
atari-binaries@panarthea.ebay.sun.com. If you are on a UUCP-only site, you
can send them to {backbone}!sun!ebay!panarthea!atari-binaries.

If you're in Europe, you can send binaries to the European submoderator,
Jan-Hinrich Fessel, at unido!atari-binaries (or, if you're a masochist,
atari-binaries@unido.informatik.uni-dortmund.de.) He will test them and
forward them to me. Submitting to him saves net bandwidth, so it's
encouraged.

If you want verification of arrival, so say in a cover note, or at the
beginning of your submission, if it is small. I try to verify that a
program works, and if I can't get it to work, I may hold up posting it
for a couple of days. Please note that, except in rare cases, software
without documentation will not be published. The backlog from receipt
to posting varies from one to four weeks depending mostly on the set
of submissions currently in my queue.

If you are submitting both sources and binaries, PLEASE send the two
separately. If I have to separate your sources from your binaries by
hand, your submission will most likely sit on the back burner for a
while.

Also, as of volume 8, I will only accept binaries packed with an archiver
for which source code is widely available. For the time being, this pretty
much means arc, zoo, and lharc. If you want to use a nifty new archiver,
make the source code available to the public (posting to comp.sources.atari.st
```

is fine.) I reserve the right to repack binaries with another archiver if the other archiver saves a significant amount of space, or has other advantages.

If you're submitting a demo of a commercial program, or a shareware program, please keep the amount of advertising to an absolute minimum. The net gods become angry when people try to use the net as a free advertising medium, and I'd like to keep comp.binaries.atari.st out of trouble. If you want to solicit orders, do it in a README file or an About... dialog box, not in a message that comes up every time the user does something. In other words, treat the net like a PBS station (apologies to those outside the US.) I will not accept programs which I feel are excessively commercial. I'm aware that commercial demos and shareware are often very useful (to the users on the net,) which is why I allow them at all.

Subject: The structure of comp.binaries.atari.st articles

Each posting in comp.binaries.atari.st is called an "issue"; there are roughly 100 issues to a volume. The division is arbitrary and may vary. There are two types of articles in comp.binaries.atari.st: binaries and "information postings." They can be distinguished by the subject line:

Subject: v13INF2: Index and other info

This first word in the title identifies this as the third info posting of volume six. Similarly, the subject line shown below:

Subject: v13i081: deadwrtr -- Ouija-word processor

identifies this as the 81st binary article in Volume 13. Large programs are broken up into smaller pieces, and have subject lines that look like this:

Subject: v13i041: zx81 -- Timex/Sinclair emulator part04/39

Certain information about the system configuration required to use the program is given on the keywords line.

Keywords: uuencode, 1meg, medium, high

This means that the program requires at least one meg of RAM and runs in medium or high resolution. Following is a list of keywords; new ones may be added as needed. They are mostly self-explanatory.

uuencode - program is uuencoded (UNIX uudecode required to unpack)
uue - program is uuencoded (ST uud required to unpack)
arc - program is archived (arc required to unpack)
zoo - program is a zoo archive (zoo required to unpack)
lharc - program is an lharc archive (lharc required to unpack)
high - high resolution
medium - medium resolution
low - low resolution

1meg - needs 1 meg of RAM

The References: line, if present, points to the previous part of a multi-part program, so that newsreaders (trn, nn, etc.) which can follow threads will recognize a large program as a single thread.

The first few lines of an article are auxiliary headers that look like this:

Submitted-by: jackt@atari.UUCP (Jack Tramiel)
Posting-number: Volume 13, Issue 80
Archive-name: rsn

The "Submitted by" is the author of the program. If you have comments about the binaries published in comp.binaries.atari.st this is the person to contact. When possible, this address is in domain form, otherwise it is a UUCP bang path relative to some major (backbone) site.

The "Reply-To:" header line in the article's main header points to the submitter, to make commenting about binaries easier.

The second line repeats the volume/issue information for the aide of notes sites and automatic archiving programs.

The Archive-name is the "official" name of this program in the archive. Large postings will have names that look like this:

Archive-name: desktop/part01

Since most archive sites run UNIX, articles are given UNIX-style filenames rather than ST-style filenames. I do make an effort to keep filenames to 8 characters or smaller, however.

Subject: Reporting and tracking bugs and patches to postings

Updates to programs are usually announced in comp.sys.atari.st. When large changes are made to a program, the entire thing will be reposted to comp.binaries.atari.st.

To report bugs, contact the person listed in the Submitted-to header. Often there is a contact address in a README file, too. I do not maintain the programs I moderate, so don't send your bug reports to me.

If the program documentation mentions some file that isn't included in the posting (for instance, a font editor's documentation might refer to some sample fonts), contact the submitter, not me. I post articles in their entirety, so if it isn't posted, I probably don't have it.

4075. v13INF2: Index of previously-published binaries

Newsgroup: comp.sys.atari.st
Date: 1990-12-14 00:20:30 UTC
From: koreth@panarthea.ebay.sun.com
Message-ID: <681@grapevine.EBay.Sun.COM>
Source record: 236353
Cross-posted to: comp.binaries.atari.st,comp.sys.atari.st

HOW TO USE COMP.BINARIES.ATARI.ST

by Steven Grimm

Last update: August 3, 1990

A preliminary note, for those of you who know most of the
below already: the official archives on panarthea are NOT
reachable via anonymous ftp from the Internet. Read on for
information about accessing them by mail, or see the table
at the end of this document for a list of alternate archive
sites.

_1. _W_h_a_t _a_r_e _b_i_n_a_r_i_e_s?

Binaries are files that contain information other than
normal text. Usually, a binary that is posted to the net
will contain executable (program) files. Binaries are dis-
tinct from _s_o_u_r_c_e_s, which are the human-readable text files
that are interpreted by a computer and used to produce
binaries. Sources can be modified with relatively little
effort, and are usually pretty easy to read. Binaries are
not intended to be viewed by a human.

_1._1. _U_u_e_n_c_o_d_i_n_g

The programs which transfer network news messages (and
electronic mail) are not always capable of handling a pure
binary file. They are designed to handle textual messages,
and the odd symbols and characters in a binary cause them to
become confused, and often to mangle the binaries. To avoid
this problem, a method called _u_u_e_n_c_o_d_i_n_g is used. Uuencod-
ing translates a binary file into text characters, so that
the news and mail transport programs won't mess up. The
disadvantages are that uuencoded files are about 30% bigger
than the raw binary files they represent, and that you have
to go through one extra step to get the binaries to work on
your computer.

_1._2. _A_r_c_h_i_v_e_s _o_r "_a_r_c _f_i_l_e_s"

Usually, a program will need more than one file to work properly. The extra files might be data files, help files, or maybe some instructions for the user. In order to easily package multiple files together in one binary file, a program called "arc" (short for "archiver") is used. Arc also compresses all the files as it packages them, so that the arcfile take up less disk space (and takes less time to download!) than it would if its contents were just thrown

together.

To confuse matters even more, two new archive programs called "zoo" and "lharc" can also be used to achieve the same effect. Zoo is superior to arc in some respects, slightly inferior in others, as is lharc. Unfortunately, you can't unpack a zoo archive with arc or lharc, or vice versa (arc and lharc are similarly incompatible with each other.)

_1._3. _U_S_E_N_E_T _a_r_t_i_c_l_e_s

The USENET has groups designed especially for transmission of binary files. They are usually called something like "comp.binaries.x," where x is the type of machine that the programs will run on. For Atari ST owners, the group to watch is comp.binaries.atari.st. Most of the binaries groups (including the Atari binaries group) are _m_o_d_e_r_a_t_e_d, which means that you can't send a program directly to everyone on the network. Instead, you send it to someone in charge of the group (the _m_o_d_e_r_a_t_o_r), who makes sure that your program works and contains the proper documentation (or that the lack of documentation is announced), and that it's in the correct format to be sent out to the rest of the USENET.

One of the restrictions of the USENET is that articles can only be a certain length. If a binary is longer than that, it must be split up into several parts, each no longer than 45000 bytes or so. This introduces yet another obstacle to people who want to transform the articles into a useful form, but it can't really be helped until the USENET starts running much more advanced news transmission software. Also, some particularly long programs may be posted over the course of several days; otherwise the net would be overloaded with lots of huge messages, and people would complain.

USENET binaries are grouped into _v_o_l_u_m_e_s, each containing about 100 articles. This is to make life easier for people who are trying to keep track of which articles have been posted. When a new volume is started, the moderator

will usually post introductory articles, including a list of previously published articles.

_2. _H_o_w _d_o _I _g_e_t _b_i_n_a_r_i_e_s?

There are two ways to get binaries: first, by reading the USENET newsgroup comp.binaries.atari.st; you will see new articles within a week (usually much less) of the time they were sent out by the moderator. If, for some reason, your site doesn't receive comp.binaries.atari.st, or if you want to look through previously posted articles, site panarthea.ebay.sun.com has all the binaries stored in its

archives.

The other way to get binaries is to request them from panarthea's archive server. The archive server is a program that intercepts incoming mail messages and looks for commands inside them. You can tell it to list the available binaries, give you help, or send whichever files you're interested in. The requested files will be mailed to you. One thing to be careful of is that multi-part postings aren't placed in the archives until all their parts have been sent out to the USENET at large. This is to prevent people from requesting all 99 parts of a program the first day it appears, thus overloading the net and defeating the purpose of piece-by-piece posting.

To find out more about the archive server, send a mail message containing the word "help" to archive-server@panarthea.ebay.sun.com. Talk to an administrator at your site if that mail address doesn't work. If you don't get any response from the archive server within a few days, something may be wrong; mail archive-manager@panarthea.ebay.sun.com to report the problem.

There are other archive sites, too, such as terminator.cc.umich.edu; they contain most of the comp.binaries.atari.st software as well as some additional programs that have not appeared on the newsgroup. Some sites, such as terminator, also offer something called "anonymous ftp" if you're on the Internet. Say "ftp terminator.cc.umich.edu", and if you connect, use "anonymous" for a username, and your username for a password. See the ftp documentation at your site for more information. A recent, but possibly incorrect, list of alternate archive sites appears at the end of this article. Please send me mail if you know of any that aren't mentioned here, or if my list is incorrect. Note that panarthea does not offer anonymous ftp, as it's on a network that's segre-

gated from the Internet.

Panarthea also offers an "auto-index" service, for people who don't have access to the USENET groups. If you request autoindex service, you will receive copies of the archive-server's index files for the binaries and sources groups whenever new files are added. Note that if your site gets comp.binaries.atari.st, requesting autoindex is pointless and a waste of net bandwidth. Send mail to autoindex-request@panarthea.ebay.sun.com if you'd like to sign up.

_3. _H_o_w _d_o _I _d_e_c_o_d_e _t_h_e _b_i_n_a_r_i_e_s?

As stated above, turning binaries from USENET articles into a more useful form can be a multi-step process. At the least, you will need the uudecode program; it is standard software on most UNIX|- systems and is available in a couple

_____
|- UNIX is a trademark of Bell Laboratories.

of forms on the Atari. Versions for other operating systems do exist, and can certainly be written with little effort. Arc is available for UNIX and other operating systems, but is not standard software. In any case, you will want at least arc on your Atari.

A version of uudecode written in ST BASIC is available in panarthea's archives (see above). It is in volume 1 of the comp.sources.atari.st directory (note that that's _s_o_u_r_c_e_s and not binaries). Once you have that, you should get the files "arc," "arcdoc," and "uucode" from volume 1 of the binaries directory. They contain the arc program mentioned earlier, its documentation, and a much better, faster version of the uudecode program.

Use the BASIC program to uudecode the two encoded files; then use arc to unpack the better version of uudecode. (Arc is documented in "arcdoc.") Note that if you're reading news/receiving mail on a computer (such as a UNIX system) that already has uudecode, you can skip most of this; you will probably just want to uudecode arc there, then download it (using kermit, xmodem, or your favorite transfer protocol - consult your site's administrator and your Atari communication package's documentation for more information. Remember to use binary mode when downloading arc files!)

So far, everything has been small enough to fit in one piece, but you will almost certainly want to try something larger eventually. The Atari "uud" program (whose source code, also suitable for compilation on UNIX systems, is

available in the sources archive) is capable of easily decoding multi-part uuencoded files. Near the top of each part (except the first) will be a line like

begin part c foobar.uac

Rename each file (except part 1, which can be named "part01" or just about anything else) to the name at the end of this "begin" line, in this case "foobar.uac". Then run uud on the file containing part 1; it contains instructions to cause uud to look for the other parts. If you have a text editor or a UNIX style cat program, you can just stick all the parts together in order and run uud on the resulting (big) file; it will try to go on in the first file if it can't find the next part in a separate file. Note that uud won't warn you if it's overwriting an existing file, so don't give any of the parts the same name as the file that's being extracted from them!

On UNIX systems, you can also say (for instance) "cat part* | uud -" without renaming anything.

Using Binaries -5-

If you don't have uud or would prefer to decode your binaries on your larger news computer, the procedure is somewhat more complex. Plain vanilla uudecode doesn't know about multi-part uuencoded files, so you have to fool it into thinking that everything is in one part. First, stick all the parts together (using cat on UNIX). Edit the resulting file. Now remove all the extraneous lines of text in between the parts -- this includes mail headers, any text, lines of the form "include foobar.uad," "table" lines and the lists of characters following them, and "begin" lines other than the one at the beginning of part 1. Once you have converted all the parts into a big uuencoded mass (with no blank lines!), the regular uudecode program will work.

Obviously, this is something of a hassle, and the recommended procedure is to try to install uud on your large computer. You'll usually want to minimize the amount of data you have to send to your Atari, since you'll most likely be downloading it at a relatively low speed, and the uudecoded .arc file is the smallest thing you can download.

Zoo is available from the archives. It is simple to use; refer to the documentation included in zoobin.arc (yes, you need to use arc to extract zoo!) for more information. The uudecoding process is the same for zoo and arc files. Lharc is also available.

Most archives contain documentation; refer to the
instructions in a specific program for usage information and
the like. If you have problems with a particular program,
send mail to the submitter (listed near the top of each
part.) The moderator doesn't have time to become very fami-
liar with all the programs that are posted, so the submitter
will probably be much more helpful.

_4. _L_i_s_t _o_f _a_r_c_h_i_v_e _s_i_t_e_s

Note: I have not verified these, so this list may be
wrong. Mail servers usually respond to the word "help"
alone in a mail message. Some of the sites listed below may
not contain full archives of comp.binaries.atari.st, and
some may have other files.

Here's question from another net, sure would appreciate any/all replies.

\/\/\/

Recv : Dec 13, 1990
To : ED JUNE
From : DAVID CHIQUELIN
Subj : Re: <4076> Connect rates

In message 3/15/4076, ED JUNE writes:

>
> Hey Dave,
>
> My I poST your question on UseNet? Maybe someone from Atari <Allan Pratt or
> John Townsend> will reply, eh?
>
Sure, you can ask about how to change the priority for the clock, if you
REALLY think that added accuracy is worth the slowdown in data transfer...
I figure Atari must have decided the clock can miss a few cycles to enable
higher actual cps rates rather than having the serial port pause while the
clock was updated.

Since the cps rate is not a necessary item, I'm not sure how much we want
to slow the system down to get it accurate... But a lot of people DO
complain about inaccurate cps reporting, so maybe it is worth it to them.

David C.

david@bdt.COM (David Beckemeyer) writes:

- Perhaps most would agree, but I don't agree at all. If you want
- the best, get the Berkeley Microsystems BMS-200 host adapter.
- Nothing else touches it in terms of getting the signals and timing
- right.
-
- ICD may be much more widely available, but that doesn't make it the
- best.

True, but doesn't ICD have the better driver software because of its caching and verifying capabilities? I have heard that the BMS-200 is better than ICDs, but I think that ICD's software that is included which, (from what I understand) doesn't work on other host adapters.

4084. Re: Help using Flash

Newsgroup: comp.sys.atari.st
Date: 1990-12-14 02:58:43 UTC
From: iho@cac.washington.edu
Message-ID: <12984@milton.u.washington.edu>
Source record: 236481

bgrave@ub.d.umn.edu (Brian Grave) writes:

>I just got myself a modem the other day and a copy of Flash (1.61 I
>think) and I need to know how to download files from my Unix account
>using Xmodem.
>
>If anyone could provide me with some helpful information I would be
>extremely grateful!

I'm not sure any of the Unix machines here do Xmodem. If, however, know how to initiate Xmodem on one of the Unix systems, it's as simple as initiating the send on the host (Unix) end, right-clicking to get the menus, and selecting Xmodem receive on your ST.

A more likely file transfer protocol candidate is Kermit. I've yet to see a university system anywhere that doesn't implement Kermit transfer. However, to the best of my knowledge, Flash (any version) will not do Kermit. You can, I believe, get a Kermit accessory from Antic. You can also get the official PD version of Kermit (not very good). Yet another option is to get a copy of Uniterm, which I believe supports Kermit.

I think the simplest solution of all is to FTP to a PC with a 3.5" drive and plug the disk into your ST.

4085. Canadian Prices for the TT/030

Newsgroup: comp.sys.atari.st
Date: 1990-12-14 03:16:50 UTC
From: art@maccs.dcss.mcmaster.ca
Message-ID: <27684422.4911@maccs.dcss.mcmaster.ca>
Source record: 236482

Just some more sample TT/030 prices
Atari TT/030 with 4 Meg RAM, $ 3,690
48mb Hard Drive (internal)
PTC 1426 Colour Multisync monitor.

Atari TT/030 with 4 Meg RAM, $ 4,190
48mb Hard Drive (internal)
TM 194 19" Mono monitor.

Same Configuration but with BOTH monitors $ 4,790

NOTE: All prices are in Canadian Funds.
They really do have TT's available for sale. Right now.

4086. C-Kermit sources for Atari ST wanted

Newsgroup: comp.sys.atari.st
Date: 1990-12-14 03:45:19 UTC
From: mooreb@iccgcc.decnet.ab.com
Message-ID: <2430.2768047f@iccgcc.decnet.ab.com>
Source record: 236393

I would like to obtain the sources for ckermit for the Atari ST.

The copy I have (C-Kermit, 4E(070) 29 Jan 88) has a bug where
weird things happen in December. The routine ztime() references a
zero-based array of month names with a one-based month index. This bug
prevents sending or receiving files unless you change the current month
to something other than December :-(.

If some kind soul could email me the sources (I have no FTP
access), I would be happy to make the fixes and return the resulting
binaries. Or perhaps someone has already noticed the problem and has a
more recent version??? Thanks in advance for any help.

--
Sorry, no fancy sig yet.

mooreb@iccgcc.decnet.ab.com (Bruce Moore)

>|
>| Is it indeed PD software?
>| ----------
>
>First Word Plus IS NOT PD!

This is absolutely true, but I am wondering if this person was really referring to First Word (the one that used to come with ST's). I am unsure if it is PD, but I would think that you could obtain a copy somehow (perhaps from ATARI). Also, there is an excellent PD word processor called STWRITER that has gone through many versions (the present one is rock solid). I do not know if it is available from atari.archive, but I know that the Current Notes PD library has it (and will update to any newer versions for free). Email me if you would like the mailing address for CN.

I am in no way connected blah blah blah . .

The First Word that came with the ST's was version 1.0 of the product you refer to (1st Word Plus). I understand that 1st Word Plus is a really good product, well supported. Now that Neocept is history, I just may invest my word processing dollars in this program, since the company is based in britain (and therefore has a chance to survive as an ST developer!!). If anyone has this guy, a review would be great!!

4090. An idea about the REVIEW topic

Newsgroup: comp.sys.atari.st
Date: 1990-12-14 04:26:06 UTC
From: boyd@mailer.cc.fsu.edu
Message-ID: <1990Dec14.042606.2123@mailer.cc.fsu.edu>
Source record: 236389

Hey, atari.archive folks! How about a directory called 'reviews' where we can place text file reviews for programs? Maybe a newreviews directory where we can initially place them, so you'all can check them for dirty words or whatever. We can adopt a naming system that includes both the name of the program and explicit version number. If you get multiple reviews of the same program, maybe you could append them together? I would be willing to contribute to this database, as I am sure others would.
Oh, it might be a good idea to use UN*X style names, so we can spell out the full name of the program (I have so much fun trying to decipher what some of the 8 character ones mean!!, but of course this makes sense for files that are intended to work on the ST). Just a thought . . . . any seconds?

Me neither, but if you are really itching to connect something there is a gadget you can buy that allows you to connect any PC keyboard to your ST that hooks to the MIDI port. You can even use the wireless infared ones. Pretty nifty, especially for those that have 1040 and 520's. You know, if Atari just made the tops of the keycaps a little smaller (thus more free space surrounding the keys) it would probably feel a lot nicer. Just my $0.02 . .

Yeah, it's called RX. It used to be advertised in ST Informer quite
a bit. While we're speaking about optional keyboards, a similar item
is Z-Keys (I think that's the name) from Zubair Enterprises. This
one connects to the pin inside the ST where the keyboard assembly
attaches. Wuztek, the multisync monitor folks, also make one.

>it in terms of getting the signals and timing right.

You might be right about signals and timing.
However, be sure to have your drive powered or disconnected whenever
you power the ST. The BMS 200 pulls down some of the ST's lines on
the DMA interface which wil fry the DMA chip if this lasts too long.
I've found out about this the hard way & I definitely do not like it.

On the other hand: the people at BMS are very helpful if you encounter
problems. I once had a bad disk, and they gave me quite some support,
even though I'm living in Europe, so phone and mail costs are not
that cheap.

Hello NetWorld !

I wonder if it exists a program that redirects the output to the printer port to a file. The problem is that I have Timeworks ST Publisher and I want to get a Postscript file so that I can print it out here on the University's nice laser printer. Publisher ST (configured for Postscript) just dumps the data to the printer port, and I want to be able to transfer it to a file instead. Anyone has a solution to this problem ?

Atari does have one for Developer use only, there are otheres, CleenUp
by ICD, but that only works with there HardWare, but try Berkeley
Microsystems, they have a suite of Utils, Pone No. 425-547-2191 USA.

>"timedrv5.prg". Within 10 minutes, I found keys that got stuck "on".

I too have recently re-discovered the Typist - or at least I think it is.
I occasionally use mystic to format higher capacity disks when I don't
want doMeSDOS (is that a UK joke) compatibility. I have found that
mouse movement too soon after clicking the format button causes a
key down fault. This appears to be the ESC key as the directory
windows are updated although pressing any key will stop the problem.
This is 100% reproducable on my system and does not seem to require
the presence of any other accessory. As yet my cure is to count to 5
before moving the mouse - but if those chasing this bug want more info
I will look at it more seriously (by email please).

Message-ID: <1990Dec14.135717.2166@idt.unit.no>
Source record: 236372

I certainly plug things in to my mega, there isn't a free slot on the
back of it :-)
Synths and Midi were the reason I bought my first St back in those
days when Tos was on disks and didn't bomb. (No it didn't bomb, it
gave you MUSHROOMS !!!, oh atari: why did you replace them with bombs ?).

As for synth sounds, I too am very interested in sounds, but for the
roland LA-series of synth's; D-50,D-10,D-20,Mt-32.
In fact, I am so interested in it that I'm writing a patch-editor for
the D-110 right now. It's in the testing stage, and the reason I post
this is to get people that want to test it. I don't know many people
over here that has the Atari/D-10 setup, so I am asking you.
The editor is completely written with ease of use in mind (read GEM)
and has an option to translate D-50 files into D-10 sounds.
When it's completely finished (and free of bugs, well almost..) I
will post it to comp.binaries. That may be never, if I don't get
anyone to help me with bug-reporting. This is your chance - Take it !

To receive a copy of the editor, write email to
erlingh@idt.unit.no

Happy synthing.

One of the guys in this discussion meantioned an IBM keyboard interface that uses the MIDI port.. Where can I find out more about this. The only thing that I have seen that allows the hook-up of an IBM keyboard is a device that costs _$99_! and is called Z-Keys I think... I would have e-mailed this to the poster, but my mailer is screwing up today....

>> Can Atari really be so stupid? Can they really? Is it possible that they
>> want to disable one of the best features of the STE, just to
>> 'differentiate the market'?

Nah, I think they just use the cheapest parts that happen to be around
on any given production run. Your conspiracy theory about them wanting
to do it to differentiate the market is far too clever. Don't give them
any more ideas. :-)

> --Someone is really making out on the deal when people buy a 1040 for much
>more.

Yes, it is safe to say that Atari is making a higher margin on the
1040 machines since the additional parts and labor do not even come
close to the additional premium you pay for the 1040 over the 520.

>
>> But I think the best that can be said about Atari the company is that it
>> would make an excellent case study for management schools, as an example of
>> how not to innovate and market IT products.

Agreed.

> Good thinking, my management book here at college already has a few paragraphs
> about Jack Tramiel as an example of bad management. (This is from when he was
> with Commodore, but nothing seems to have changed.) :-(

That is interesting. He must be famous. He is also mentioned in a book
used by my friend at Columbia Business School in connection with the
fall of Commodore after the initial success of the Vic-20/C-64 boxes.
I'm sure he is making money regardless of how he butchers the company.
It is the stockholders that are getting burned.

>Steve Greer

Welcome to comp.sys.atari.st
============================

This newsgroup is devoted to discussion about 16 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, and STacy.
There are also emulators for the Apple Macintosh and IBM XT available.
Finally, there is the Lynx (a game machine) and the Atari TT and ATW.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.

Associated newsgroups include:

comp.binaries.atari.st
comp.sys.atari.st.tech
comp.sources.atari.st
```

CSAST
What sort of articles would interest people reading comp.sys.atari.st?
==========

The most interesting articles are technical articles, impressions of software/hardware, information on Atari user-groups and shows, or helpful hints on how to make better use of the machine and its software.

The least interesting articles are in the form of 'my computer is better than...', especially when cross-posted outside of comp.sys.atari.st. If you don't know how to eliminate other newsgroups from a reply to an article which is cross-posted, ask your systems administrator.

'FOR-SALE' articles should be posted to misc.forsale, and ONLY local distribution of comp.sys.atari.st. Those outside the United States have little desire to read about that neat bit of [hard/soft]ware you're selling when you live in the U.S.A. If you don't know how to restrict distribution of a posting, ask your systems administrator.

Many articles are in the form of "How do I...?" or "Where do I...?" In this article, I will try to answer some of the most-often asked questions.

PD
Where can I get Public Domain/Shareware software?
==========

There are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st mail server. You can also try the commercial on-line services such as GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those ending with the suffix of .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

For anonymous FTP: atari.archive.umich.edu [141.211.164.8]

User anonymous
<enter password>
cd /atari

The atari.archive server is now available via e-mail as well. To find out more about bart (the mail server), send a message to atari@atari.archive.umich.edu with a body of "help". You will get a message back with the help file.

For anonymous FTP in the UK: uk.ac.lancs.pdsoft

User pdsoft
Password pdsoft

This is a national public domain archive, available to sites in the UK only via JANET. Mail access is available from within the UK - send mail to archive-server@lancs.pdsoft for information.

For anonymous FTP in Europe: unido.informatik.uni-dortmund.de
[129.217.64.60]

Some selected Atari ST software is in the directory pub/comp/atari-st

There is also the info-server, a mail server which (among other things) mirrors the panarthea archives. Unfortunately it is not up to date and presently contains only volumes 1-10. You can get more info about the server by sending any mail to info-server@unido.informatik.uni-dortmund.de. It will reply with usage instructions.

For anonymous FTP in Europe: cs.uni-sb.de [134.96.7.254]

Contains the most interesting tools of the german PD-scene, most of the GNU programs ported to the ST (including ports of emacs and bash and an extended version of bammis library for gcc) and also ports of software posted to comp.sources.unix, alt.sources and comp.sources.misc.

For the panarthea mail server, see Steven Grimm's monthly posting.
Panarthea holds all of the comp.sources.atari.st/comp.binaries.atari.st postings. If you aren't reading these two newsgroups, you should consider doing so.

ARCS
How do I deal with Archived files (.ZOO, .ARC, .LZH)?
==========

Files ending with suffixes .ZOO, .ARC and .LZH are archive files. They are binary files which may contain one or more other files in a compressed format. Archive files usually take up less disk space, and for this reason have become quite popular for transferring large files via modem.

In order to extract the files from an archive file, one must use an archive program. Here are the correspondences:

ARC Use ARC.TTP
LZH Use LHARC.TTP
ZOO Use ZOO.TTP

These programs are all available via FTP from the atari.archive server, in the /atari/archivers directory. Recommended files are:

arc.ttp - needed to extract the other archivers, once.
arc_602.arc - latest version of ARC, with the most fancy features
and quite a lot of documentation
lharc.arc
zoo_bin.arc

Julian Coleman recently (December 1990) uploaded an archive starter pack to the atari.archive server. His announcement reads:

" I have just uploaded an archive starter pack to Atari.Archive. It contains the following :

arc / lharc / uud / uue / zoo
U. Michigan monthly posting (05 Dec 90)

The file is 'starter.tos' and is in the form of a self-extracting lzh archive, so only needs to be downloaded (in binary mode !) and run. The archive contains sudirectories and needs about 350k when extracted."

This is probably the easiest way to get hold of the various archiving programs if you have access via FTP and can transfer the binary file to your Atari ST.

There are also several GEM programs which act as 'shells' for the archive programs. The most popular are Shareware offerings, also available on atari.archive server. They are:

arcgsh35.arc - European in origin

arcsh197.arc - US in origin

Both are located in /atari/archivers

The GEM shells are recommended for inexperienced users (and appear to be quite handy for the experienced user as well!) They require a copy of the archive program -- in other words you need BOTH the GEM shell *AND* the archive program in order to use the GEM shell.

Documentation on the use of the archive programs should accompany the archive files mentioned above. To use ARC.TTP in order to extract these files, use the command line:

xh xxxx.ARC *.*

where 'xxxx' is replaced by 'arc_602', 'zoo_bin', etc. For example

xh arc_602.arc *.*

will place all files within the arc_602.arc into the current directory. It assumes you've clicked on the ARC.TTP program from the Desktop and have the parameter dialogue box on your screen.

In many cases, simply typing a '?' or 'h' will provide an extensive list of available options.

Source and binary code for archive programs have also been posted to comp.sources.atari.st and comp.binaries.atari.st. They are available via e-mail through the panarthea archive server. See Steven Grimm's posting for more information on how to obtain files from panarthea.

ERR
What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

Below is a letter, originally written by Darryl May,
that John Townsend of Atari posted on GEnie in January to provide some answers. This letter also appeared in the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA 22170).

Dear ATARI customer,

The following is an official list of the errors that can appear while you are operating your ST computer. This first list gives you the GEM error messages:

Error description GEM Error code
==
OK (no error).....0
Fundamental error.....1
Drive not ready.....2
Unknown command.....3
CRC error.....4
Bad request.....5
Seek error.....6
Unknown media.....7

Darryl May
Tech Specialist

PAINT
What is the format for [x] paint program data?
==========

There is a periodic posting of ST Picture Formats, edited by David Baggett. The file is on the atari.archive server under /atari/graphics/picfmts.doc.

GDOS
What is GDOS, and where can I get it?
==========

GDOS stands for Graphic Device Output System (at least that's what my copy of STart, volume 1 number 1 said...)

You can get a copy of "Everything You Ever Wanted to Know About GDOS (and more)" by Douglas N. Wheeler from the atari.archive server. The file is /atari/programming/gdos.arc.

There is a German version of GDOS available from the atari.archive server. The file is /atari/utilities/amcgdos.arc.

Currently, there are no truly public domain sources for the GDOS system files or font files (at least those supplied by Atari). You can get these files with many commercial programs, such as Degas Elite, WordUp!, etc. You might also want to check your local user group to see if they received a copy of the WordFlair demo program (also available on GEnie). The demo program appears to have the GDOS system and font files.

TEX
Is TeX/LaTeX available on the Atari ST?
==========

The TeX/LaTeX typesetting programs are available on the Atari ST. Check the atari.archive server under /atari/tex. Fonts and device drivers

(including one for the Epson 9-pin printers) are available on the
atari.archive server.

LANG
Public Domain/Shareware languages...
==========

Check the atari.archive server under /atari/languages. Currently included:

abc recently posted to comp.binaries.atari.st
apl demo version
forth Don't know which one. I recommend Bradley FORTH
icon
modula-2 From Germany
Sozobon C Most excellant
Elan
xlisp
xprolog
xscheme

GNUC
Is GNU C available on the Atari ST?
==========

You can also get the GNU C program, which runs on 1 megabyte Atari ST systems.
For more than minor programming, you may need to upgrade to 2 or more
megabytes, as the GNU programs generally assume you've got plenty memory.

GNU C for TOS is available via anonymous FTP on atari.archive. It is also
available via anonymous FTP on cs.uni-sb.de [134.96.7.254]

DEV
How do I become a developer for the Atari ST?
==========

Contact Gail Johnson, Atari Rep Person, (408)745-2568

Gail can explain the program to you, and send an information packet if you so
desire. Basically, for a $250 registration fee, you gain a 10 pound box filled
with over 1500 pages of documentation, software -- including a compiler (Alcyon
C) and a demonstration builder, a newsletter, and technical support. There is
currently no differentiation between commercial and non-commercial developers,
although it would appear that Atari is considering changing that some time in
the future.

[Note: there is an Independent Atari Developers Association, which -does-
require you be a commercial developer to join, but it is -independent- of
Atari...]

ZNET
Where can I get copies of ZNET?
==========

ZNET on-line magazine is available on CompuServe and GEnie. You can also get copies mailed to you by sending an e-mail message to

stzmagazine-request@virginia.edu

indicating you wish to subscribe.

They won't get to you on Friday (which is when they're posted), but Greg Lindahl provides an excellent service to the networking community by sending these out.

ZNET and some information from the Current Notes user magazine are also available from the atari.archive server under /atari/magazines.

PALS
ST Pen Pals list
================

Simon Chappell is compiling a list of people interested in exchanging paper-based mail "of interested parties who could then keep in touch and prevent themselves losing touch with the ST community at large (this would be especially easy if someone who still had net access could summarise current topics or forward news and advice!)"

He is accepting entries in this format:

eg Simon Chappell.
s61304@uk.ac.psw.pa (NOTE: NO LONGER VALID ADDRESS...)
51 Amherst Road, Penny-Come-Quick, Plymouth, Devon, PL3 4HJ. UK.
C, operating systems (UNIX, VMS) & relational databases.

Contact Simon at his paper mail address if you are interested.

TIPS
TIPS AND HINTS from other users
==========

Any 'multisync' monitor which handles 70 video fields a second can be used with the ST; the custom cable involves no tricks, or commercial ones are available. The original NEC multisync does NOT handle 70 fields a sec.

More than 3 bombs often means more than 1 error, so interpretations are tricky.

An ST-formatted disk which is not readable by a PC can be made readable by putting the 3 bytes EB 34 90 (those were 3 bytes of hex) at the beginning of the boot sector (sector 1 of track 0, I believe). This can be done with either an ST or PC absolute sector editor.

Some (older) PC-3.5"-drives cannot deal with the short track-header produced by ST formatters. On those drives, ST-formatted disks are not readable, independent of their boot sector contents. The other way, however, does always work: format on the PC.

When using disks formatted on a PC in an ST, make sure to insert and access a disk with a different serial number in between disk changes.

For those with the 'inaccessible' mouse and joystick ports, a joystick extender cable will make life easier. The Y-cable joystick extenders make it extremely easy to keep mouse and joystick connected to port 0, and a joystick extender cable in port 1 makes for easy hookup after you've moved the machine.

-- David Paschall-Zimbel

4112. uploaded to atari.archive

Newsgroup: comp.sys.atari.st
Date: 1990-12-14 16:04:35 UTC
From: ralph@laas.fr
Message-ID: <RALPH.90Dec14170435@orion.laas.fr>
Source record: 236358

For those of you who want the new TeX 3.0 (3.1?) only the binaries were
put onto atari.archive. This morning I've uploaded the complementary
*.fmt, *.tfm, *.mf, *.vf that are necessary to build TeX, LaTeX, or
SliTeX:

```
-rw-r--r-- 1 ralph 547195 Dec 11 16:37 formats.lzh
-rw-r--r-- 1 ralph 138928 Dec 11 17:10 mfbfonts.lzh
-rw-r--r-- 1 ralph 577178 Dec 11 17:31 mffonts1.lzh
-rw-r--r-- 1 ralph 355327 Dec 11 17:35 mffonts2.lzh
-rw-r--r-- 1 ralph 209420 Dec 11 16:58 mfpandor.lzh
-rw-r--r-- 1 ralph 342243 Dec 11 16:14 tfmfonts.lzh
-rw-r--r-- 1 ralph 100562 Dec 11 16:16 vf_fonts.lzh
```

Some of the file names are longer than 11 characters within these
files, so they will have to be handled carefully.

I would have also uploaded the following, which includes latex.tex:

```
-rw-r--r-- 1 ralph 377144 Dec 11 16:35 inputs.lzh
```

except for the fact that lharc can make it, but neither lharc on my ST
nor on my SPARC can test or extract the archive. It seems that lharc
is *STILL* bugged.

Cheers and enjoy,

--

|> I wonder if it exists a program that redirects the output to the printer
|> port to
|> a file.

Yes, "Barrel" by Moshe Braner does this. It captures anything that goes to
the printer and saves it in a RAM buffer which you can save on a file
later.

4114. Re: Ghost mouse

Newsgroup: comp.sys.atari.st
Date: 1990-12-14 17:23:10 UTC
From: whoffman@jato.jpl.nasa.gov
Message-ID: <1990Dec14.172310.25845@jato.jpl.nasa.gov>
Source record: 236367

I found the vibration from my hard drive system is just enough to send my mouse scurrying to the side if I happen to leave my mouse _just_ right. I can't seem to set it up to repeat the action but just *lifting* the mouse stops it right away.

I'm interested, (I'd like to run my 296N with 1-1 interleave 8-)
but I have several questions:

Does the BMS 200 verify at all? How long can the Acsi cable be?

How do the various third party caching programs compare to the *very*
fast ICD caching driver? Give some sort of measurement please.

Is there some program out there truly comparable with ICD's Cleanup or
the Supra Utilities, e.g. Beckemeyer's Hard Disk Sentry?? Michtron's
Tune Up currently does *not* cut it.

Does the BMS 200 support removeable media - especially Syquests 8-)?
I do know that Berkley Micro can supply tape drivers (and advice)
for many of those cheap tape drives that are out there.

Has anyone tried to use the BMS 200 with Spectre GCR (especially with
a 296N or 277N on 1-1 interleave 8-), do any of those Mac SCSI add on
devices (e.g. a hand scanner) work with it? I doubt this, but maybe
something other than a hard disk *does* work, if its driver stays away
from the Mac hardware.

Finally, does anyone know if ICD fixed up their newer adaptors to be
more like the Berkley one?

Thanks for any info,

Bob Pegram

>Bible?
>
>--
> Dipl.-Inform. Rainer Klute klute@irb.informatik.uni-dortmund.de

Since there were a lot of people interested in the Spiritware
concordance program, we might as well use the news to discuss it. I
was surprised to recieve an email from the author of the program, Don
Clifton. Dirk Husemann sent me email mentioning the same issue of
having a German version of the database to be used with the
Concordance program:

* Is it possible to include other bible versions into this system?
* E.g. here in Germany the Elberfelder text (a translation that tries to
* keep a close to the original texts as possible and thus pretty good for
* bible study) is PD. The - christian - publishers decided to place the
* ASCII text in the public domain to get the word spread. So it'd be
* kind of nice to have this Spiritware system for the Elberfelder text.

I asked Don this same question and his response was:

% A port to the German Bible shouldn't be too difficult, but I am not
% familiar with the German keyboard, or how umlauts are handled. Anyway,
% I would be willing to try to make it work.

If someone can help Don with these problems, it will facilitate the
port of the German Bible.

About putting the entire KJV on atari.archive, I, and others, feel that the
2.5 Megs of data is just too much to upload/download. The address for
Spiritware was already posted previously, so I would recommend those
who would like the program to just order it from them. The cost of
both NIV and KJV is the same (or less) as only one version of a commercial
concordance program for the IBM PC/Mac. Plus, you get their
outstanding support.

I'm sure the question that is burning in your mind is what Don
Clifton's email address is. Here it is:

don@milton.u.washington.edu

If you want an order form or more information, you can email him. If
you want an unbiased objective opinion ;^), you can email me. :-)
BTW, I have both the NIV and KJV versions of the Concordance.

-later,

Maurice

Source record: 236384

boyd@mailer.cc.fsu.edu (Mickey Boyd) writes:

|>First Word Plus IS NOT PD!
|
|This is absolutely true, but I am wondering if this person was really
|referring
|to First Word (the one that used to come with ST's). I am unsure if it is
|PD, but I would think that you could obtain a copy somehow
|(perhaps from ATARI).

The original First Word (FW) doesn't seem to be available any longer. As I understand it, FW was supplied with ST's in the early years, but it is not PD. I didn't get FW with my Mega2, but I liked the FW concept so I bought FW Plus (FWP).

|The First Word that came with the ST's was version 1.0 of the product you
|refer to (1st Word Plus). I understand that 1st Word Plus is a really good
|product, well supported. Now that Neocept is history, I just may invest my
|word processing dollars in this program, since the company is based in
|britain (and therefore has a chance to survive as an ST developer!!). If
|anyone has this guy, a review would be great!!

Well, FWP is no WordPerfect nor is it competition for MacWrite, but for occasional letter writing or short papers it's quite serviceable. It's just not very sexy. I don't know of any bugs in the current version 3.14; in that regard it is a big improvement over FW. The mail merge facility is supposed to be excellent; I don't know, I've never used it.

In this list, games have been rated on a scale of 1 to 10, 10 being the best and 1 being the worst. For each game, the total number of votes, the average rating, and the vote distribution are shown. New games are indicated by a "*" before their entry. If a "(C)" appears after the title it means that the game is a CD-ROM or disc system title. If a "(J)" appears after the title it means that the game is currently only available in Japan.

The general guideline for ratings is:

8-10 worth buying at full price
6-7 worth buying at a discount, or if you're particularly interested in this kind of game
3-5 only worth renting
2 only worth playing for free, and only for a few minutes
1 worthless

The vote distribution uses a single character to represent the percentage of votes for each ranking. The following character codes can appear:

"." no votes cast "3" 30-39% of the votes "7" 70-79% of the votes
"0" 1-9% of the votes "4" 40-49% of the votes "8" 80-89% of the votes
"1" 10-19% of the votes "5" 50-59% of the votes "9" 90-99% of the votes
"2" 20-29% of the votes "6" 60-69% of the votes "*" 100% of the votes

Please consult the article entitled "ABOUT THE VIDEO GAME RATINGS REPORT" in the newsgroup rec.games.video for more details, including information on how to vote.

Questions, comments, problems, and errors should be directed to the list maintainer at either of the below addresses:

4128. Atari 520ST CPU only, for sale

Newsgroup: comp.sys.atari.st
Date: 1990-12-15 05:03:36 UTC
From: lchiu@cory.Berkeley.EDU
Message-ID: <9791@pasteur.Berkeley.EDU>
Source record: 236398
Cross-posted to: comp.sys.atari.st,rec.games.video,rec.games.vectrex

For sale, Atari 520ST with RF modulator. 512K, it's a stock machine. No drive, just the CPU. $80 or for the best offer. Or, I will trade it for Genesis games. (<-- reason for posting to rec.games.video.)

Or, I will give it to someone who will build me a "null" cartridge along with all of the Vectrex games on EPROMS in return. (<-- reason for posting to rec.games.vectrex.) If this is too unreasonable, please tell me, I have no idea whether I am asking for a monumental task or not. I want to negotiate!

The ST works perfectly. I got it for games and the games for it are really looking like crap compared to the games on the Genesis nowadays.

Thanks,
Lawrence Chiu

- Is this in fact not true?

I read something a while ago that mentioned that the version 8 ROMs on the 296N will only give a good transfer rate on the ST at 2-1 interleave, but even then, it's only around 400K/sec. (K/sec is the correct measurement for transfer rate, isn't it?) The version 7 ROMs let you go 1-1 interleave and therefore you supposedly get a much higher transfer rate. If you format at 1-1 with the version 8 ROMs, you get an incredibly poor transfer rate, somewhere around 40K/sec.

Message-ID: <1990Dec15.180349.4778@santra.uucp>
Source record: 236402

There is a competitor for the UltraScript, called T-Script. According to Fearn & Music, a company in Germany, the T-Script is more effective and more reliable than UltraScript. They use it for producing graphics from Aldus Freehand, PageMaker etc. under Spectre GCR. I think their opinion is worth believing, because they sell both UltraScript and T-Script and the difference between the prices of these is so small that it does not have any part in forming that opinion. (I have seen them sold with equal price)

Source record: 236403

There are good and fast emulators! I have the ATonce by Vortex GmbH,
having 8 MHz 80286, and there is the ATspeed that has no big difference
when compared to the ATonce. ATonce supports RS232 and other ST hardvare a
bit better than ATspeed. There is no big difference in their prices,
Hard & Soft A.Herber in Germany has both with same price!
But there is something coming that may be worth waiting for...
Omega Computer Systems in Germany is about to release a board that
contains both 16 MHz MC68000 and 16 MHz 80386SX, both with 16 kb cache and
both with socket for math co-processor. It also has max. 3 pcs. 16bit AT-
slots for VGA-card etc.! And there is a possibility to have a max of
4 Mb RAM on the board, making real multitasking between TOS and MS-DOS
possible! I received these information about 2 months ago as a telefax
from the company itself, containing a full price-list. They were not
ready for deliver one then, I haven't tried later.

Message-ID: <1990Dec15.183447.5757@santra.uucp>
Source record: 236404

1st Word Plus is definitely not a PD program!!!
It is a very good program made by GST-Software, and the price-tag
has no little numbers on it!
If you ever find one from a PD-library, hang the keeper immediately.
I think that no-one having something called common sense would
upload this software to any PD-system! Download... I would, just to check
the version out. (I have bought mine)

From: jmack@b11.ingr.com
Message-ID: <9690@b11.ingr.com>
Source record: 236405

I am trying to add a 5 1/4" drive to my 520 ST. What restrictions
are there on the drive I buy? can I use 40 or 80 track drives? 360k or
720k? (I don't want to bother with 1.2Meg)
Also, I have the pin descriptions for the Atari drive cable as well
as descriptions for the standard 34 pin drive connection. Is there anything
tricky about building the necessary cable outside of just matching the
descriptions/pins and connecting them?
I hope I'm not digging up an already well discussed subject here, but
I sure could use the help. Thanks.

Cary McCormick

>this way--too bad, they are a good group.

Seems to me that the issue of getting a NeXT is more than just finding out that the NeXT is a great computer and that with a discount it probably costs about the same as a TT.
My questions would be: How much does the cheapest color Next cost? How much is NeXT software? What about entertainment software for those times that you just gotta shoot something (most of it is probably PD)? Do I have to buy the NeXT laser printer or could I use a third party printer (Even at that discount price, not everyone has the money for a laser)? Can I be productive on the NeXT the same way that I was on the ST without too much costly software and/or hardware add-ons (productivity spans Music, Business, Desktop Publishing, etc)? Many ST users in general like their ST because of the wide variety of things that can be done on it without too much expense. And if I need color, it's just a monitor away (okay, so the color isn't 24 or 32 bit). Also, if I got a NeXT (or an Amiga 3000UX or a Mac IIsi) I would lose my software. Granted, it's the price one pays for a 'better' system, but I can't afford that price, even if I can afford the new system.
This isn't to say that a NeXT (or whatever) isn't interesting, but a TT looks awfuly good if the overall cost to me ends up being less for upgrading to a new system.
I'd really like to hear from people who switched systems and how expensive (or inexpensive) it was, Atari management issues and such aside. (But that doesn't belong on this board, so mail me).

4139. Re: Just gripin'...

Newsgroup: comp.sys.atari.st
Date: 1990-12-15 22:38:50 UTC
From: hastoerm@vela.acs.oakland.edu
Message-ID: <4277@vela.acs.oakland.edu>
Source record: 236409

Wow. This is a change. First, let me confess, I am an Amiga
owner who's peeking in on the other groups. I'm not here to flame
anyone on the Atari ST or anything like that, though, so don't worry.

I'm checking in mainly because I was wondering what had
happened to all the ST people and just happen to pass by the newsgroup
during an RN scan. I can remember a time when locally (Michigan) the
BBSs were alive with the Atari ST people predicting that Commodore
would die seeing as Atari beat them to the market and how the ST was
out selling the Amiga 7-1. Heh. In a way, I kind of miss those folks.
I know of only one Atari ST person in my local area who is active on
any of the BBSs in the area. One.
So I thought I'd peek in to find out where they had all gone.
At one time, I had considered them a nusiance as it seemed they were
always coming into the Amiga echos on Fidonet and starting arguments.
(It never really occurred to me that some Amiga folks were doing the
same on the ST Echos at that time, though now I know they did.)
Now, some of these posts are almost depressing. I know how
much I love my Amiga and how disappointed I would be if it didn't
look like it was going anywhere, etc. As much as I want the Amiga
succeed, I don't want the ST to do badly. Imagine what all those guys
who bought TI99's must feel like!

Just thought I'd take a moment to mention this: If Atari does
end up calling it quits, and you guys make the transfer to another
machine, just thought I'd let you guys know that some weirdo in the
Amiga market has come out with an Atari ST emulator. It's called the
Medusa Board and it seems to run rather well. At least you won't have
to give up all your old software in the switch. With an accellerated
Amiga, it is said the board will run ST software twice as fast as a
normal ST. Weird.

Anyways, good luck. This wasn't meant to start a flame war or
anything. Just felt like speaking my feelings for a moment.

-Moriland

P.S. You guys got one great victory over Amiga. You have Lords of
Conquest for the ST. It's never been ported to the Amiga and I've
always wanted a copy for my machine. Great game.

>>Get a Mac, not an IBM. IBMs are for corporate fascists, and besides,

Get a life. I'd recommend an IBM clone before a Mac. I don't even OWN
an IBM anymore. (Sold it to buy a second Amiga.) Macs are indeed very
easy to use, but the price they ask is simply outrageous. Combine that
with the fact that they are poorly designed and most of them have
trouble with the latest version of the OS, and it adds up to a bad
idea all the way around. Part of the reason these folks BOUGHT an ST
in the first place was because they didn't feel like shelling out the
big bucks you need for a Mac!

>
>$3000 is a REAL LOT of money. Maybe my STs aren't Macs, but I've invested all
>of $500 in my Atari stuff. I just can't see where buying a "home" computer
>for the price of a car is a good move, sorry.

Heck, for $3000 you could get an Amiga 3000! I mean, if you're going
to go spending that much money, might as well get something you won't
need to expand right away!

Commodore's Student Discounts are amazingly deep. A good friend of
mine bought the 25MHz version A3000 just recently for only $2600!
(Normally it is closer to costing $4000.) It would seem that Commodore
was giving the monitors away free as a promotion at the time so the
1950 (around $500 cause it's multi-sync) didn't add any extra cost.

4143. Files sent to atari.archive

Newsgroup: comp.sys.atari.st
Date: 1990-12-16 00:13:14 UTC
From: ekrimen@ecst.csuchico.edu
Message-ID: <1990Dec16.001314.23855@ecst.csuchico.edu>
Source record: 236413

I've sent the following files to atari.archive.

DCUDEMO.ARC - Demo of DC Utilties.

MASTER.LZH - Demo of Master Sound.

MONARCH.LZH - Colorful demo with good sound, from Oregon.

NEWORDER.LZH - New Order hacker demo.

STZMAX01.LZH - ST Music Disk #01. This disk features some
Soundtracker mods and player.

SYNC.LZH - This is a demo of Audio Sculpture. It says 'Audio
Scupture' on the upper right corner and it says, "Demo
version" on the right side of the screen, so I assumed
it's a demo of Audio Sculpture. :^) It plays,
manipulates, and I think creates Noisetracker mods. It
displays a very colorful spectrum analyzer when the mod
is playing. To load a mod, click the disk icon and hit
L MODULE. I've tried loading mods off my hard drive
and it just crashes. To play the mod, hit the triangle
on the left. The square stops it. I'm not sure what
the other triangle and the circle does. Selecting the
pencil and jagged line icon brings up a type of
sampler program. (From the main screen,) Selecting
the speakers lets you change some of the program's
configuration. I've also included FLETCH.MOD, a
Noisetracker mod of the theme from the movie, "Fletch."
Unfortunately, this program doesn't play the mods in
stereo on the STe. (Use STEPLAY to hear FLETCH.MOD in
stereo -- it's a good one.) It does work on both the
ST and STe. I don't know if it will work in
monochrome.

A long time ago, I looked into this for TeXShell, so I could spell it with an 'E' half a line down. I had used rsctoc to imbed the resource into my C program. Upon looking at the stuff in the resource file, it was obvious that all coordinates were stored as 256*pixels + characters. And the fixup-routine just knew how many pixels tall and wide a character are, and converted everything to pixels.

So all you have to do is modify the fixup routine to treat the pixel offsets in a resolution-independent fashion, and you're all set.

>this is for memory, and i have not written AES/VDI code in quite some time.

Ditto.

>Not to mention that the FCC and VDE require you to attach something to every
>port which can conceiveably be used simultaneously. For FCC testing, these
>peripherals have to be turned on! So you get their emissions...

Plus the horror stories of things like this: you hook up a monitor or
printer or terminal (which supposedly has passed FCC), and *it* is
putting out so much RFI that your own unit "fails".

I can sympathize with Atari... we're going thru an FCC approval right now.
Something always holds things up. For instance, first the lab wanted
a ground strap on the keyboard connector. Okay, so they ship the unit
back, the strap is installed, the unit goes back to the lab, but now it
was damaged in shipping, etc etc. Then the lab is busy with other stuff.
It goes on and on. What should take a week, takes literally months instead.

Sometimes I'm surprised that *any* equipment actually makes it to market.

Unfortunately, the developers of 1st Word Plus, GST, seem to have largely abandoned development for the ST market. They do still support their products with advice, etc. (for a price), but no bug fixes have been forthcoming of late. There was a report in ST World, I think, that they were about to do some more development of Timeworks DTP, so I don't know if Atari have been able to spur them into action again with the launch of the TT...

4153. MiNT 0.7 now available

Newsgroup: comp.sys.atari.st
Date: 1990-12-16 14:56:19 UTC
From: 7103_2622@uwovax.uwo.ca
Message-ID: <8086.276b44c3@uwovax.uwo.ca>
Source record: 236423

MiNT version 0.7 is now available at atari.archive.umich.edu, in the "mint" directory (where else?). In case you're not familiar with it: MiNT is a freeware multitasking system that's (mostly) TOS compatible, and that provides Unix-like features such as pipes, signals, job control, and pseudo-terminals.

New features in version 0.7:
(1) Runs on the TT now (thanks to Allan Pratt).
(2) The ability to read/write Minix partitions just as though they were TOS partitions (thanks to Stephen Henson).
(3) Better memory management, particularly in fork(). Those of you running MGR will notice that you can open more windows now. The kernel is no longer limited by an internal memory pool, nor is the process table size fixed.
(4) CTRL-ALT-C and CTRL-ALT-Z interrupt and suspend processes even if the terminal is in "raw" mode.
(5) The sample shell ("init.prg") now supports wildcards, aliases, and variable expansion (again, courtesy of Allan Pratt).
(6) Lots of bug fixes.

The files available are:
(1) mint07b.zoo: binaries for the MiNT kernel, init.prg, gem.prg, and bgacc.acc
(2) mint07s.zoo: source code for the MiNT kernel
(3) mntutl7b.zoo: binaries for various MiNT utilities, such as kill, pipe, bg, and miwm
(4) mntutl7s.zoo: source code for the utilities in mntutl7b.zoo, plus source for init.prg and bgacc.acc
(5) akputil7.zoo: source and binaries for miscellaneous utilities for use with the init.prg shell (e.g. rm, ls, cp). (Written by Allan Pratt).

4154. Possibly a dumb question concerning fonts, Fontz!, and bitmap fonts

Newsgroup: comp.sys.atari.st
Date: 1990-12-16 18:32:43 UTC
From: ggreenbe@rodan.acs.syr.edu
Message-ID: <1990Dec16.183243.516@rodan.acs.syr.edu>
Source record: 236424

A program called speedfnt comes along with ATSpeed. The
program allows you to load fonts for use in msdos mode. It
suggests you use 4096 bytes hires bitmap fonts. Well, I've
started looking for a font editor for the msdos world, but
then I realized that I already have a font editor, namely
Fontz! I tried loading a font I had made for use in hi-res
mode on the ST, but all that showed up were a bunch of little
dots/specks...clearly this would not work...but then I
rememberd that you can change various things when desigining
fonts in Fontz! So, I was just wondering if anybody out there
knows whether or not Fontz is capable of the type of font that
I will need (I figured I would ask here, seeing as how Neocept
is out of business now[at least that is what seems to be the
case based on earlier discussions concerning WordUp]).
Post to the net, or email me directly...Thanks!

Well, we have Z-modem here on our VAX, and I use XYZ.TTP for downloads. I
have no idea where we got it though, you might want to check VMS ftp sites.

Date: 1990-12-16 22:14:29 UTC
From: vousten@neabbs.UUCP
Message-ID: <511550@neabbs.UUCP>
Source record: 236427

I uploaded the following to atari.archive. Available now...

...from the atari/archivers directory:
LH_CATCH.LZH A utility to make Yoshi's LHARC.TTP v.1.1309 (included in the archive) work with Charles Johnson's ArcShell. It catches the command line the shell sends to LHARC, asks additional info (Include path names?), modifies the command line and passes it on to LHARC. Doc included.

...from the atari/printing directory:
PRINTCMS.LZH A small program to print 132-column listings from a VM/CMS mainframe (file type LISTING) correctly on an Epson FX compatible matrix printer.

4158. saving GCC errors

Newsgroup: comp.sys.atari.st
Date: 1990-12-16 23:08:48 UTC
From: rcb@netcom.UUCP
Message-ID: <18949@netcom.UUCP>
Source record: 236428

I am using GNU C inside of Gulam 1.04.05 to do some porting (of Z-modem version 3!) and this would be much less painful if there was a way to save the compilation errors in a file. I don't think GNU C has any listing option (if so, I'd sure like to know!). Another method I was thinking of was to re-direct the standard error output to a file, but apparently Gulam doesn't have that feature either. Any ideas?

I agree with Andy. We usually use a text editor here, but occasionally
use 1st Word Plus.

4161. MiNT 0.7 bug (and fix)

Newsgroup: comp.sys.atari.st
Date: 1990-12-17 06:56:15 UTC
From: 7103_2622@uwovax.uwo.ca
Message-ID: <8090.276c25c0@uwovax.uwo.ca>
Source record: 236431

There's a serious bug in MiNT 0.7. The code that attempts to recognize Minix partitions can fail on some AHDI formatted drives (ones with >1 logical partition in a physical partition); as a result of this failure, MiNT crashes.

There is a simple "fix" for those of you who encounter this problem and have the source code: in the file mint.h, comment out the line that says:
#define MINIX_FS
and recompile.

If you don't have the source code/can't compile it, a "fixed" binary is included in the file mint071b.zoo which I've uploaded to atari.archive. Two versions of the program are included: the one identified as MiNT version 0.7.1 is the binary without Minix filesystem support, which should work on all drives; the older MiNT version 0.7 is included for those of you with Minix who don't use AHDI. Read the "readme.1st" file in the archive for more detailed information.

NeoDesk uses GEM. What I'm talking about is a RAM loadable version of the AES, VDI and the Desktop program. That way Atari can add more calls to the AES and VDI plus fix bugs. NeoDesk has to take what it can get.

>keyboard and plugging it back in again. An option not available to me!

We get this on real Mac Plus machines as well. Rebooting usually fixes it.
I haven't had this under Spectre recently - I believe I had it once under
a very old version of the system software (3.2??) but not under 6.0.2/3
It may be be worth checking the settings in the Control panel are set
correctly...

There ARE some problems with the UK keyboard map on Spectre affecting some
characters such as hash, tilde, backslash, etc. This is supposed to be fixed in
Spectre 3.0 when it appears.

HYPERFORMAT indeed does all these things, but it's not PD. It's part
of my book 'Scheibenkleister', therefore it can only be obtained
legally by buying the book. Just to put in a grain of salt 8-)

You're right with your theory concerning the hardware mod for 1.1 MB
disks. It was published last year in the German computer magazine
'ST-Computer'. In late summer 89, a friend of ours developped the
High Density solution for the ST (1.44 MB, PC-compatible disks),
and HYPERFORMAT supports these formats, too. It packs up to 21 sectors
on one track, totalling a whopping 1.7 MB on a standard 3.5" HD disk.
In Germany, several other PD programs are available that do extra
stuff with your disks; most of them also include some kind of
twister format.

>
> ....Thanks ahead of time... .....Yonderboy@cup.portal.com

Well, at the moment I have about half a dozen disks that I use daily that are double sided, 84 tracks and 11 sector - gives me about 930 Kb. I've been using them for about 8 months now with no problem - BUT I do use high quality BRANDED disks (mainly TDK and Sony), lesser quality disks just do not cope. Anything past 10 sectors is risky, and to find out how many tracks your drive can cope with you can (though not really recommended) tell it to format 85 tracks and listen to the drive - when it stops going clunk after every track then you've gone to far (ie you can format to one track less than the one you're on).

MOST drives will happily cope with 82 track/10 sectors...

heavy@zip.eecs.umich.edu (Richard Scott Hall) writes:

> I agree, I am always interested in what other good programs are out
> there, and like Don said, I haven't0Q even heard of some of the ones
> mentioned...

So this is my personal annotated software list for the Atari ST.
I use an old 1040ST from 1986 upgraded to TOS 1.4 and 16MHz
(Hypercache by proVME) and 4MByte.

I don't have the time to review the programs (there are four german
magazines doing this for the Atari ST/TT) but if everyone just tells
what he is using regularly, we all might learn something.

I have a SM124 monochrome monitor and don't know wether these programs
run on color monitors. Signum and Harlekin work only with 640 x 400.
220-ST claims to run on color monitors.

Most addresses are German, D-____ is the German mail code.
DM is Deutsche Mark, 1 US$ is about DM 1.50, but changing daily.

Name Program Address Comments
Version Price

ST Pascal Pascal Compiler CCD Very good standard

4173. BOOT ME UP! (comms help wanted)

Newsgroup: comp.sys.atari.st
Date: 1990-12-17 13:41:40 UTC
From: slp9m@cc.usu.edu
Message-ID: <1990Dec17.074140.45076@cc.usu.edu>
Source record: 236442

I have owned a 1040 ST for several years. It was purchased for the purpose of doing a few routine tasks which it performed using a limited set of software. While it has performed these tasks well, I could be getting a lot more use out of it. I have seen several archived binaries that would likely help me in doing just that. I have just one problem. That limited set of software does not include a communications program capable of doing file transfers.

Here's where I need someone's help: I would like to get ahold of a copy of Uniterm. (Even if it isn't the latest version, that's fine as long as I can use it to download the latest version.) If anyone would be willing to send me a version via US mail, please E-mail me with the address and I will supply a formatted disk, self addressed stamped mailer, etc. Thanks in advance to the willing volunteer.

Source record: 236443

"Mindbomb" isn't aa game. It's a demo by The Lost Boys... probably the greatest Demo writers on the ST!

In fact there's probably no "probably" about it!

It has a message at the start stating that it should not be sold by any PD library without prior arrangement with Budgie UK.

It's well worth getting hold of though...

Cheers,

Jamie.

4175. Re: uploaded to atari.archive

Source record: 236449

A while back there was some discussion about the status of Neocept, the makers of WordUp...The concensus was that Neocept had gone out of business. Well, in the December issue of Current Notes, in the STUPDATE article, Frank Sommers states that Neocept announced "'an intermission' and possibly a final curtain call for WordUp". The gist of the story is that Neocept cannot continue to improve their products while providing support...which is why they made arrangements with E.Arthur Brown to distribute the upgrades...and that the future of Neocept and WordUp depends on the future of the ST. I guess we can only wait and see.

Yes, get a copy of pscapt.prg, which works exclusively for this problem, or get a copy of Moshe Branner's barrel.prg which is more versatile. If barrel isn't on the atari.archive or at panarthea, I could upload my copy to one or both (a good exercise for me, I haven't done it yet for either 8-). If I get no response, I won't do either, I'll just send it to Martin if he asks. BTW, if someone could post, or tell us where to get a copy of pscapt, I'd be grateful, my copy was corrupted.

> floppy disks. It did not come with any instructions. Can you
> help me to get it going? Is there some software needed?

Yeah, you need something to slow down the step rate to 6 msec from 3
and a 40 track formatting program. Check out the various PD Control
panels, at least one of them (schizo??) can set the head step rate.
DC formatter will format 40 tracks, as will Hypercopy and several
other formatters. DC formatter can also write an MS Dos bootsec and a
bootsector for the ST to set the step rate to 6 msec. Oh yeah,
NeoDesk 3.01 also has *everything* you need to handle 360K 5.25 disks.

good luck,

> britain (and therefore has a chance to survive as an ST developer!!). If
> anyone has this guy, a review would be great!!
>

People at our research unit have been using 1st Word Plus for several years. IMHO:

Wordplus is OK, but has not been upgraded as well as it might. Its advantages include:

Good easy-to-learn interface; easy setting of common things like bold, underline, etc.; adequate, extensible spelling checker; .IMG files can be imported & moved (though not rescaled or resized); handles multiline footnotes OK (though will not split footnotes across two pages); printer drivers are quite easily configurable; comes with mail merge program (separate) and 'snapshot' accessory to capture images if you don't have a better program to do this; can print multi-columns, but only after you've finished editing (multi-columns is a mail merge feature!)

Disadvantages include:

Paragraphs are not automatically reformatted when text is inserted or deleted; no support for multiple fonts; no *proper* support for half-line spacing; suffers from variations on the 'phantom typist' theme (worst one is in v3, which sometimes just freezes keyboard & mouse input, giving you no chance to save); no autosave feature; no thesaurus; no option to view control codes or spaces (extra spaces at the ends of lines are significant during reformatting); slow scrolling if you're a line-at-a-time keyboard-type of person; no outliner.

I'd call it an OK middleweight program getting a bit long in the tooth now. Producers GST Software Products make more money out of PC stuff than ST stuff, so they've neglected to upgrade ST programs recently. They do have an upgrade to Timeworks Publisher in the pipeline (though from what the guy said it's not going to be anything major), and I heard they showed an improved TT version of Wordplus at a recent show. I still use it (in preference to ST WordPerfect), and its easy interface counts for a lot, but I'm not sure I'd buy it if I were starting from scratch.

French people are lucky. I've seen Le Redacteur v3, and that looks pretty wonderful. The document processor Calligrapher is about to be relaunched in the UK, and that sounds promising. Apart from that, Protext has lots of features if you can stand the non-GEM interface; maybe new (to me) programs like Script, WordFlair or That's Write are good, and Tempus Word will certainly be fast. I'd be interested to hear of any experiences people have had with these programs. The ST certainly isn't short of word processors, but few dealers outside favoured countries like Germany stock many of them, so it's hard to find out how good they are.

Cheers,

Graham

I'll do my best to check out exactly how the memory in the 'new' STEs
sold in the UK is configured. I've seen the story about how STEs are
being sold with something other than SIMM memory in so many places that
I'm fairly sure there's something solid here - but I don't know exactly
what's going on. Maybe Richard Imlach (the original poster on this) has
some hard information.

This is called the 'Phantom Typist.' This is a bug with the ST. No
one knows what kind though. It could be TOS, it could be something
else. It happens not only with First Word Plus, but other word
processors as well. Atari won't consider it a bug, unless someone can
reproduce it at will. Until someone can make it appear on purpose,
it will still remain uncatchable.

> it go in the auto folder? Does the UNIXMODE environment variable have
> to be set first, before I run unix2dos? Does it work with non-GCC
> programs (it doesn't seem to, so far)? Thanks for any help.

As far as i know, Eric Smith is working on integrating the UNIXMODE features into his MiNT kernel. At the moment it requires programs that recognize the UNIXMODE environment variable.

The unix2dos program allows you to use slashes (/) as directory delimiter and the /dev-notation for drives without any settings of environment variables or intervention of a shell. This is useful if you do ports of unix-programs (or use such ports) and don't want to include the stuff for parsing the A: notation in any program (eg when those unix-programs assume that absolute pathnames start with / and that the only use of backslashes (\) is to mask control characters).

The unix2dos program is not required if you have programs understanding the UNIXMODE environment variable. It only gives you a similar interface for filenames if your programs can't use UNIXMODE. You can mix both ways to convert slashes (with the unix2dos TSR and the programs doing it themselves) without any problems and the tools using UNIXMODE are also able to understand the backslash-notation too.

> David Megginson

Hope this helps!

Well, several people have expressed interest in this project... If people mail me reviews, I could combine (and organize) them and post on atari.archive and c.s.a.st.

Disk space is no problem (well, many many megs would be bad, but ... :), so send all you have.

>>[.....]

>Hey, do these folks have a phone number?!? If their stuff is on sale, I have
>a buddy that would probably buy a VideoKey. Where did you see this sale
>advertised?

Well, that's the rub. It's for dues-paying User's Group members only. Says so on the order form. If you can find a nearby Atari User's Group, you may have time to pay your dues and get the order form before the offer expires. In fact, the way ST support is going on this side of the oceans, it's well worth your while to join a User's Group "just because". Despite what people are saying, the ST is going the way of the C64, Apple II, ...

I'd send you my order form, but I threw it away already.

Try setting your packet size to 94 (bytes?kbytes?), on both ends. It's slow, but safe.

A lot of machbines running Kermit like to set an enormous packet size like 1000+, and it really screws up other machines. At least they give you the chance to change it as the need arises.

4194. TT compiler

Newsgroup: comp.sys.atari.st
Date: 1990-12-17 19:58:08 UTC
From: ens@ccu.umanitoba.ca
Message-ID: <1990Dec17.195808.21818@ccu.umanitoba.ca>
Source record: 236312

I just got a TT030 last Friday (ordered Monday) from Atari Canada. For 4 meg RAM, 48 meg HD, it cost 2900 Cdn (~2400 US); the multi-res monitor (ST-low, ST-med, ST-high, TT-low, TT-med) was another $750. Those are educational prices. First impressions: it is noticeably faster (the desktop is close enough to instant, pagestream runs much more smoothly), the ST-high mode is _almost_ as good as the SM124 screen, the desktop is disappointingly similar to TOS 1.4; fortunately NeoDesk runs.

If anyone has information on what compilers are available that can take advantage of the 68030, 68881, the VME, the TT-low and med resolutions, etc, I would be grateful to hear about them. Atari (Canada) recommended Hi-Soft C form Europe. So far I haven't found a North American distributer. Will megamax upgrade their compiler; that would be cheaper for Laser C owners, and probably a faster compiler.

You need a program in the auto folder that will slow down the seek rate delay for the FDC chip. "ST" drives are 3ms but most 5 1/4 drives are about 5ms. The chip can handle from 2ms - 6ms. E. Arthur Brown has the software to do it (it includes formatters and stuff) for $15. I don`t know if there is aPD version.

4196. Sozobon Sprites

Newsgroup: comp.sys.atari.st
Date: 1990-12-17 21:18:12 UTC
From: jimomura@lsuc.on.ca
Message-ID: <1990Dec17.211812.21144@lsuc.on.ca>
Source record: 236314

And now for my progress report:

It seems that Sozobon C only supports "sprite" calls properly
if you use "minimum.h". I understand that this can be a problem
because it may mean that GEM is not supported if you use "minimum.h".
So for the time being, it would seem that you either develop a
GEM application or a Sprite application. At least that seems to
be a way of looking at it. It turns out that I could complete my
current program without Sprites, though it would have been a better
program if I could use them, and so I'm not concerned. I intend
to proceed with another program that will need sprites but not GEM
later so this will work out satisfactory as well.

Now on to another question. I haven't reached the point where
this question is important quite yet, but I will soon.

In CyberPaint, Jim Kent used a custom menu interface which I
really liked. I've seen similar menus in Amiga programs. The menu
bar is hidden until you click and then it appears at the top of
the screen and menus drop down covering only part of the "work" area
leaving the rest visible. This is particularly good for graphic
programs of an artistic nature because, unlike Degas, it leaves as
much of the "work" on-screen at all possible times. If you're not
an "artist" you may not realize why this is important at first, but
if you've ever done extensive art it becomes a fairly obvious matter.
At any rate, I like the idea generally and even though my current
project is not a "paint" program, I would like to impliment this
type of menu. But I've *never* seen it done in GEM/TOS programs.
As such, I have a feeling it's probably not possible. Does anybody
know for sure? It would seem to me that if I define a "window"
with 0 height but with a "menu bar" I should be able to do the same
type of thing, but would the drop down menus work over the window
underneath? Or would I have to define the window to be at least
the height of the largest drop down menu?

From article <7062@tekgen.BV.TEK.COM>, by boblu@tekgen.BV.TEK.COM

(Robert Luneski) quotes me from my article: <1990Dec14.172830.14752@uvm.edu>

>>I'm interested, (I'd like to run my 296N with 1-1 interleave 8-)
>>but I have several questions:

Then replies:

> You do not want to run a Seagate 296N at 1-1 because the disk transfer rate
> is less than 90 kb/sec at that interleave.

Yes I do! At home I have old postings about this. Someone from Berkley
Microsystems claimed that Seagate tests all 277Ns and 296Ns with a 1 to 1
interleave, and listen to you (figuratively) slack jawed when you
complain that you can't run them that fast. The problem, I am given to
believe, is in the host adaptors we use, only the BMS 200 really meets SCSI
standards currently, or so I hear (yeah, I know, you could say that
the 2XXN series is barely SCSI too 8-). BMS *currently* advertises with a
line saying something like: <if you have a 296N or 277N and want to
run it with 1 to 1 interleave, call us>

> Formatting it at 2-1 interleave raises the transfer rate to over 430 kb/sec.

(or lowers it to that if you're running a BMS 200 8-).

Deletions....

> ____ ____
> /\/\/\ Bob Luneski /\/\/

I'll dig up the posting I mentioned (thought I had it here too) if
anyone's interested. I'll also dig up Berkley's phone and address so
you can check with them directly.

Check it out - I might be right - and wouldn't all the 2XXN owners
be happy then!

Well, only unhappy about the DMA port overloading that occurs when
the BMS 200 is off, that someone stated in a posting today 8-(.
I hope that's been fixed.

your 'umble servant, ;-)

rcb@netcom.UUCP (Roy Bixler) writes:
>I am using GNU C inside of Gulam 1.04.05 ...
>re-direct the standard error output to a file..

Here's a program that does what you're after. It compiles under MWC, GCC, and Alcyon C. It works best under Gulam because Gulam implements shell_p, a way for a child of Gulam to say "here, Gulam, please execute this command line for me." It may not be the best 'c' you've seen, but it works.

(Interesting note: the MWC executable is 3622+690+188=4500 bytes text+data+BSS (almost all text; real small), the Alcyon C executable is 6834+1434+9124=17392 bytes (half is GEM binding BSS), and the GCC executable is 19592+904+3812=24308 bytes (just big). The GCC "system" call from Bammi's library is by far the most complex; I don't know what else makes it so much larger. I tried to use "minimal.h" for the GCC version but it didn't work: system() must use something from main.c.)

```

| I've sent the following files to atari.archive.
|
| CK_DEMO2.LZH - Demo of Codehead's Codekey macro program.
|

If anyone has Neodesk 3.00 or 3.01, and you want to try out this demo (or you've purchased the real thing), here's a tip that will save you some time.

If you run NEOLOAD.PRG as an auto program, there is a conflict between CodeKeys and Neodesk 3.0x that results in a 9-bomb crash when you try to record a macro. This can be resolved by not running NEOCNTRL.ACC. Macros seem to play back OK with NEOCNTRL.ACC loaded, however.

I understand that Gribnif and CodeHead know about this and are presumably working on a solution.

If you have a question, PLEASE post it here. PLEASE DO *NOT* SEND E-MAIL! Somebody's new mailer out there is causing me a peck full of trouble!

> Just wondering.

Okay, my wonderfully inactive-becoming-senile-21-year-old brain
mislead me. From all the wonderful email I found that the new NeXTs
have a 2.88 meg floppy drive. One writer said that they are SCSI. If
this is true then I assume all that remains in connecting it to the ST
is software to format it and whatnot (Besides a ASCI to SCSI adapter).
But am I missing something? This seems promising.

From: saj@chinet.chi.il.us
Message-ID: <1990Dec18.032534.17936@chinet.chi.il.us>
Source record: 236324

I have a ST296N running full speed at 1:1 interleave on my ST. The key is that it's attached to a BMS 200 host adapter. Vance from BMS explained the problem over the phone a long time back; here's how I remember it:
The ST296N requires that the host adapter acknowledge receipt of a data package within a time window that's at the very low edge of what the SCSI standard dictates. Most host adapters at the time didn't respond quite fast enough to satisfy the drive when it was formatted 1:1. The BMS 200 responds fast enough. Perhaps other host adapters do by now, I'd have no way of knowing.
Anyone from Seagate reading this? Care to give more details?

Steve J. saj@chinet.chi.il.us

>I recently bought a PCF554 disk drive that is designed for 5.25
>floppy disks. It did not come with any instructions. Can you
>help me to get it going? Is there some software needed?

Well, I have had a knowledgeable reply.
It seems that there is a program "PCF554.PRG" written, apparently,
by someone at Atari and distributed to developers. Now, it seems
that this program will help me to make use of this disk drive in
a way that it becomes more useful than a door stop.

No here is my problem: my contact, a highly honorable developer, is
uncertain about the legal status of the information (code?) sent to him
that allowed him to type in and assemble the program "PCF554.PRG".

Could the folks at Atari comment on this?
Is it legal for someone to sell or give away this code?

I have heard that there is a low-memory system variable that looks
like it might be the thing to change but it isn't.

4209. Phantom typist and Timedrv5 (Was: 1st Word Plus)

>reproduce it at will. Until someone can make it appear on purpose,
>it will still remain uncatchable.

I had not seen the Phantom Typist for quite some time. But recently I saw that there was a new version of Time-Drive, so I installed "timedrv5.prg". Within 10 minutes, I found keys that got stuck "on". One that got stuck in the on position was the "ESC" key. Things still worked, while the speaker chirped continuiningly. It was almost by accident that I discovered it was the ESC key. What did it for me was that I was logged in to a unix system at the time and was using a terminal emulator program talking to to a system that that showed the control characters that were coming in to the system. (For UNIX buffs, I think it was " cat -v ".) Just pressing the ESC key once stopped the problem! Over the next hour or so, this happened several times, so I disabled timedriv5 by changing the extender ".prg" to ".prx". and re-booting the system. Of course next time I booted up, the time and drive indicator was not there, but the key chirp hasn't come back either.

I hope this helps and that I don't get somebody's nose out of joint. My comments are make in the hope that we can isolate and anihilate this bug.

Lee Dickey

OK - This is the relevenant bit. I don't have any other info about this. It may
be worth contacting HiSoft directly for up to date information. Their phone
number is +44 525 718181.

From "HiSoft News", dated December 1990:

"We are very sad to say goodbye to Michtron, our former US distributor, which
has now closed down. We were always pleased with the way they sold our
software. We are now happy to be working with Lauren Flanegan-Sellers and
Goldleaf Publishing of San Fransisco and we hope to be able to make an
announcement to our North American customers quite soon."

4212. LZW-compression

Newsgroup: comp.sys.atari.st
Date: 1990-12-18 09:40:45 UTC
From: bmkraats@cs.ruu.nl
Message-ID: <4534@ruuinf.cs.ruu.nl>
Source record: 236330

Does anyone out there have a description of the LZW-compression algorithm?
I am looking forward to see it...

Thanks,

Berto.

> difference between the prices of these is so small that it does not have any
> part in forming that opinion. (I have seen them sold with equal price)
>

I would be very interested in reading more information about either
T-Script or the French Postscript emulator (Graphix??) which was
mentioned in a recent posting. I heard that Imagen have ceased
supporting Ultrascript for the ST. Can anyone give more info on this?
What exactly does 'ceased supporting' mean? Will the program still be
sold, but not upgraded?

In the UK, the only official way to get Postscript emulation for the ST
is to buy the desktop publishing package Fleet St Publisher v3, and even
then there is something about the program which is incomplete (it might
be the range of fonts - I'm not sure).

All info appreciated.

This should not be needed, as the Arcshell21b does have a Programerball
option, when you click on Add or Extract, just hold the Alternate key
down, this will give you a Small Gem box, that lets you put in a
Command Name, this is for your Information, will also be seen on the
screen when running, and the Command string that you want to send to the
Arching program, these Command options can be saved when you save the
config, it is posible to use this shell with any of the LZH's that are
around, ie. LZH121/LZH12/LZH60 etc and even ZOO, this Major option
is seemed to be overlooked, but it is in the Doc's...
I have used it with a few of the LZH's and found no problems..

Roy> Roy
Roy> netcom!rcb@apple.com

Here are some diffs to gcc.c, which do just what you want. I
introduced a new command line option (-z), which, when in effect,
redirects stderr to a file. If you don't have the sources, drop me a
note for the executable.

4222. FTP Problems adn Atari.Archive

Newsgroup: comp.sys.atari.st
Date: 1990-12-18 21:37:15 UTC
From: weiner@terminator.cc.umich.edu
Message-ID: <1990Dec18.213715.3079@terminator.cc.umich.edu>
Source record: 236342

Recently we've received some complaints concerning messages that
appear when you attempt to log on via anonymous ftp. The warning
says something like "host no longer available for ftp after Jan.1, 1991".

If you haven't reveived this message, and you've ftp'd here recently (within
the past week) don't worry. Continue to hum along merrily and smile.

The problem here isn't that atari.archive will not be available after
the new year. It's simply that our host is incapable of doing a reverse look up of your
internet address.

The solution is simple, ask (no, demand) that your sys-admin properly
register your machine in the in-addr.arpa namespace.

Please don't send me mail concerning this matter. It's very simple. After
the first of the year, if our machine cannot look up your machine in the
in-addr.arpa namespace, you will not be allowed to ftp here.

Thanks and have a wonderful holiday season.

4224. SC-1224 and Laser for garbs

Newsgroup: comp.sys.atari.st
Date: 1990-12-18 23:43:29 UTC
From: Xorg@cup.portal.com
Message-ID: <37055@cup.portal.com>
Source record: 236344

FOR SALE:

Early Atari SC-1224 color monitor. This guy has seen very little use since two years ago when I bought a mono monitor. The display is far sharper and more colorful than any newer Atari color moniotrs I've seen. Mint condition - $225

Atari SLM-804PCV Laser Printer. Bought less than a year ago and seen very light use (ok, I'll admit it, I bought a 386 and my ST system has seen little use since then) Includes UltraSCript, the Postscript emulator ($200 by itself) I'll also toss in lots of PD software and probably a couple of commercial games I have lying around. First $850 takes it.
Peter Szymonik
xorg@cup.portal.com

4225. Files okay.

Newsgroup: comp.sys.atari.st
Date: 1990-12-18 23:46:22 UTC

Source record: 236346

These are some good Cyber (.SEQ) animations that I have posted to
atari.archive.

deja_vu.lzh - A Fuji symbol spinning on a scrolling, patterned floor.
froggie.lzh - A strange frog.
manta_2.lzh - A stylized manta ray with fins moving.
pt7_step.lzh - A futuristic creature.

audio.lzh - A better demo of Audio Sculpture. This one includes
STe support. You can even change the volume, bass,
treble, etc., by clicking on the 'STE DMA' selection
under the speakers option. Clicking on the button on
the lower left 1/3 of the screen will bring up another
window that shows the notes instead of numbers. To
change the staff for the different voices, click with
the right button on the green numbers. To extract
this file after unLZHing it, you need Magic Shadow
Archiver. This file was sent to me by Lars-Erik
Osterud. Thanks!

>the desktop is disappointingly similar to TOS 1.4;

I believe you're wrong there. Please read your manual. Or just look at the menus; they should tell you how different it is. In the default configuration, it does look like the ST Desktop, so as not to be confusing to ST users, but it's really very different. Anecdotal evidence of how different it is: the Neodesk guys are mad at us for copying their ideas (we didn't).

Yes, there are other ways of transferring files between a VAX and the ST. I have Xmodem and Zmodem on our machines at work. For some reason Kermit is the only protocol that got REALLY popular among VAX sites (I suppose this is due to the fact that Kermit allows you to transmit 8 bit binary files over communications channels that only support 7 bits, which used to be the case quite often).

Anyways, I'd be happy to put the Xmodem and Zmodem programs for the VAX on a tape for you (or anyone else who wants them).

>MOST drives will happily cope with 82 track/10 sectors...

Whether or not you can use 11 SPT is not up to the quality of the disk but the speed of the drive doing the writing. The slower a drive is, the more chance you have of using 11 SPT. A faster drive will screw up the data though.
Using beyond 80 tracks is dangerous. I know from bitter experience because using 82 tracks trashed my drive years ago and I had to replace it.
If you use beyond 80 tracks and it works with your drive, fine BUT I don't think it would be fair to give your disk to someone else and trash their drive.
The use of disks formatted this way is forbidden in our ST lab for just such a reason.

The maximum sensible format is 80T, 10SPT, 3SPF.

From: nf@ecs.soton.ac.uk
Message-ID: <5920@ecs.soton.ac.uk>
Source record: 236254

HELLO WORLD

Looking through the postings on the newsgroup I noticed people
talking about TeX on the ST !!!!

Could somebody tell me how I can get a copy ????

Answers could be either placed in the network or send to me directly
e-mail : nf@uk.ac.soton.ecs

Thank you in advance

Nick

4235. Re: 1st Word Plus

> this problem?

Oh yes. Oh yes. Also (with UK version 3.xx - 3.15 is current) it sometimes just stops accepting keyboard and mouse input, effectively freezing the program. Wordplus doesn't have an autosave function, so when this happens you lose all you've typed since the last time you saved manually. It doesn't seem to depend on how fast you type. Even the slowest typists here have had it happen to them.

The producers of Wordplus say it's something in GEM (which might be borne out by the fact that similar 'phantom typist' problems happen with other programs). Atari spokespeople generally say that it's to do with the way the program handles keyboard input. Nobody, except for a few users who've realised it's not just their fault, seems to be interested in tracking down the problem. Atari tech people tend to use text editors rather than full word processors, and GST (the originators of Wordplus) don't worry too much about the ST market these days, as they know they've already made most of the money they're ever going to make from the program.

So you, and we, either have to grin and bear it or change to a new program and probably a new machine too. People here at Sussex University (where literally hundreds of STs have been sold in the last five years) are taking the radical option and moving away from the ST altogether. Users who mostly use just wordprocessing software tend to blame 'the Atari' when they lose an afternoon's work - they're not too bothered about where the problem lies. IBM and Microsoft are now making a lot of money here because of the bugs in the Wordplus/Atari combination.

Shame, but there it is.

Graham

|> making it relatively diffucult to read without TeX. Would someone
|> please
|> output it to ASCII format and send me an e-mail message with the ASCII
|> output?
|> I'll post it to atari.archives as soon as I get it.

A note from the Arcgsh author: Before I decided to post the documentation
in TeX format only I tried to produce an ASCII version also by running it
through dvi2tty. The result did not satisfy me. Especially the tables
showing the Arcgsh menues got disordered. Including the TeX source enables
anyone to read the documentation even without TeX (contrary to posting the
dvi file which would have been really mean to the non-TeXies).

But ok, if you want to have it anyway: If I get more than 10 requests for
it I shall post it here and include it in former Arcgsh versions.

Is this phenomenon related to the typing speed of the individual? I
rarely do gung-ho typing on my Mega4 ST, but I have had no problems
whatsoever with timedrv5.prg.

>What exactly does 'ceased supporting' mean? Will the program still be
>sold, but not upgraded?

What has always astonished me about UltraScript is the lack of
a screen previewer. It would have been *so* simple to add.
Since the SLM804 is a dumb printer they have to prepare the bit
image in memory anyway, so just popping up a window and some bitblt
operations would have been all the labor to make a previewer work.

The UltraScript implementation of the PostScript engine itself is quit
robuust though. Never had any problems.
But considering the additional features of GRAPHIX I would certainly
have decided in their favor...

>Its own ram disk, everything. I wonder of the writer of The Vault
>made the same assumptions, but did not build in the checks to make sure.

Please, keep your cool and don't start speculations flying on the net.
All that Lars reported is that he has a problem running THE VAULT and
DCACHE together. We don't know what the problem is, but we are trying
to find it. Meanwhile, don't run them together. They both apparently
work fine for most people most of the time when used separately.
TURTLE, too, seems to work well for many people, and I don't
understand your implicit criticism of it.

The problem with the VAULT/DCACHE combination could lie with either
program, and it is not necessarily due to one of the writers making
"assumptions"---it could be due to a plain old ordinary unintentional
bug: accidently overwriting memory not belonging to the program, using
a signed int someplace instead of an unsigned, a problem with the
compiler or a library routine, etc.

4242. Author of The Vault speaks.

Newsgroup: comp.sys.atari.st
Date: 1990-12-19 16:14:11 UTC
From: fischer-robert@cs.yale.edu
Message-ID: <27876@cs.yale.edu>
Source record: 236262

I'm Bob Fischer, the author of The Vault. I recently (October) got an
E-mail address, and am now available directly. My address is:

rfischer@cs.yale.edu

If you have something to say about The Vault and you want me to hear it,
please send it directly to me. I do not read the newsgroup, so posting
messages about bugs with The Vault, not working with Program X, etc.
is not likely to get any bug-fixes from me.

Here's the current status of The Vault, and what I plan to do in the future.
The current version, 2.01, is the only version ever released to the public.
Right now, I am using version 2.03, which lets you do multiple backups from
the same starting directory. I have only one hard-disk partition and
that way I can back up my system and user files from the root directory.
I never distributed 2.03 because its .VDF file format is different -- the
.VDF file needs an extra line to store an extra piece of data. I was
planning to rewrite the .VDF file format anyway into an extendable version,
and didn't want to confuse the matter with The Vault 2.03. If anyone
really wants it, I can send The Vault 2.03.

But now, I'm working on The Vault 3.00. The Vault 2.03 is written mostly
in Pascal. I kept having great ideas of how to expand The Vault, but the
already-written routine was in C in a way that couldn't interface well
with Pascal. For example, I can't use anything using the malloc() call.
So I've converted The Vault to C, and the result is The Vault 3.00. It
still bombs in quite a few places, so I don't want to release it quite yet.
With Christmas vacation, I hope to work on it a lot, but I promise nothing...
Meanwhile, The Vault 2.01 works. I still use 2.03, because 3.00 doesn't
work well enough yet.

The Vault 3.00 has two differences with 2.01. It lets you do multiple
backups from one folder, and it formats disks twisted. I don't use Twister,
but instead my own program called FastFlop which speeds up on STANDARD
disks faster than Twister. The only problem is, it uses UNDOCUMENTED
locations. I was about to release a version which would work on a number
of versions of TOS, but then I found a bug and did a quick fix for
the version which I was using (I think TOS 1.4 in ROMs).

With The Vault 3.00, I plan to release the source code to people who
ask for it, under certain conditions. I don't have the conditions
here, so more on that later. In short, if you want to be an
Alpha/Beta tester for The Vault, I will send you the source code and
you can find bugs, fix them, make improvements, etc. The Vault 3.00
is written entirely in C and Assembler, and compiles for me with Mark
Williams C version 3 and MADMAC. The advantage of being a tester is,

when you find a bug, you can fix it yourself instead of trying to explain it. You also get the newest releases of The Vault, before I really believe they're bug-free. Of course, anything in The Vault beta test version is likely to go wrong and mess up your backups.

Here are some future improvements I'd like to make to The Vault:

* Fully automated backups. The Vault would keep track of your backup sets for you. Say you have three backup sets SET1, SET2, and SET3. The Vault would know you most recently backed up to SET1, and when you say Full Backup, it would tell you to use SET2. It can also keep track of Incremental sets this way. I'm not quite sure yet what backup patterns different people use, and therefore which ones to program in. So why not, tell me about your backup procedure (if you have one).

* The Key sucks. I'd like to include it in The Vault, make restoring much more automatic and user-friendly, add fancy wild-cards to it, add dual mode. Maybe even a cache on the hard disk to improve its speed. Anyone interested in writing a better Key, I'll send you the source code to the current, and do whatever you want. Better yet, I'll tell you how to restore split files, which is the only special thing about The Key.

* I want help where you need it, which is not in the Help menu. I'll change so that there's a little 'Help' button in every dialog box. Pressing it brings up the apporpriate help box.

* I want to speed up incremental backups using a technique similar to that used in DSCAN.

* I want to put icons and windows on The Vault's desktop so you can browse through the files on your hard disk and look at them while in The Vault.

* Every now and then, I toy with the idea of data compression and writing non-TOS-format disks. I'm not sure if I really want to do this, though... Or maybe I could find some really clever hack to write while I'm reading the hard disk.

* It would be nice if The Vault worked with tape backup systems. I don't own one, so I don't know how to write software for one.

* An option where you give The Vault a list of files to copy and it copies them, something like a fancy cp command. It would be more useful then as a general copy program.

So what do you think? What improvements would you like to see made?

I've written a bunch of programs which I never posted but am thinking of posting. Which would you like to see? Here's a description of them:

* RD, a resizeable (but not reset-proof) RAMdisk. It's really resizeable because you can resize it from anywhere -- in a shellscript, etc. It takes its memory off the high end so as to not

fragment memory.

* FastFlop, described above. Maybe I'll release the current version,
and make it only install on TOS 1.4 in ROM.

* I reworked Moshe Braner's Flexcopy to use GEM.

I hope to hear from you, and I hope that you find The Vault useful.

> Steve J saj@chinet.chi.il.us

I second the motion, but in my case, I'm also interested in getting
the best current set of TeX programs. The multitude of ports, and
versions, and sub programs (e.g. showdvi, LaTeX) is confusing me, and
I can't afford to keep copies of everything and then figure out what
combination works (it would probably fill 20Meg easily 8-). I'd like
to read a good intro before FTPing and shelling out for the other books.
thanks,

Hi:
I've seen a bit about this before I guess I didn't pay too much attention.
Which DS drive mechanisms are best for upgrading an Atari 354 drive to DS?
I've heard that some have problems after being installed and others require
a lot of cutting of the case. Which ones work best and require minimal cutting
for the conversion?

Any info is greatly appreciated!

Message-ID: <52416@eerie.acsu.Buffalo.EDU>
Source record: 236268

Hi..
I wrote a multi user inventory system for the ST using DBMAN and RTX,
after using DBMAN, it is very similiar to dbase, but also has many
problems. The version I was using (I think it was 4.0??) crashed
ALOT.. and I was never able to get the compiler to work. Many of
the commands available serve the same function as Dbase but are
called up under different names. Its been a few years since
I used DBMAN, so I reallly dont remember my complaints. But I
was not impressed.. To date I havent found a database that I still
can use on the ST...

There are better comms than Uniterm...Can you get the British magazine
STFormat? In the latest issue there is a really hot terminal prg on the
coverdisk that is included to every issue. I you are not capable to
reach one, give me a message and we'll sort this problem out somehow.
Tried Flash? It is commercial, but good. (maybe not as good as the other...)

That product you are hunting is Spectre GCR, made by Gadgets by Small.
You should enter a message here subjected something like:
Wanted: connection with Gadgets by Small
or Wanted: David Small from Gadgets by Small
and ask him. (he is the developer of this emulator)

Or get a ST oriented magazine, American one preferred. There is certainly
at least one ad concerning it in that magazine.
I purchased mine from Germany. At least there they were able to sell
both the emulator and 128k Mac ROMs at the same place.

That continuous stream of email asking info about it was a bit a surprice!

For those who are about to send email to me, please read this first, then,
if something is still dark over there, ask.

(I am not working for Omega!)

Here is the information I promised to give you. It is a rather bad translation
from german, hopefully there are no big missunderstandings.
(I should take those lessons in german)

DELTA MODUL

386sx AT-Emulator for Atari ST/Mega

Hardware

Intel 80386sx 16MHz processor
16 Kb cache
socket for 80387sx arithmetic co-processor

Motorola MC 68000 16MHz processor
16 Kb cache
socket for 68881 arithmetic co-processor
average acceleration 170% compared to original ST

16 bit AT-slot
total of 3 cards possible
(for example VGA or SuperVGA graphics-card)

RAM-expansion 2 or 4 Mb
makes possible to run MS-DOS- and GEM-program parallelly

Software

Switching between operating systems is like switching between
programs.
MS-DOS programs are started from GEM-Desktop.
Supports ST hardware, like DMA, serial port, parallel port, clock etc.

Graphics-emulations: Hercules, CGA
MS-Mouse compatible driver for Atari Mouse
VDI-driver for using VGA-graphics-card under Atari GEM

Prices

Delta Modul AT-Emulator 1.198,- DM
1x 16 bit AT-Slot 29,- DM

2x 16 bit AT-Slot 39,- DM
3x 16 bit AT-Slot 49,- DM
RAM-card 2 Mb 898,- DM

4255. Favorites List

Newsgroup: comp.sys.atari.st
Date: 1990-12-19 22:42:21 UTC
From: whitcomb@aurs01.uucp
Message-ID: <59394@aurs01.UUCP>
Source record: 236275

This is in response to the call for lists of favorite software. I am new to the network, but I have been an ST user for four years. I initially got the ST for MIDI purposes, but I have also done some development. Anyway, here goes...

MIDI STUFF

Dr. T's KCS OMEGA. This includes what was called KCS Level II (with the Programmable Variations Generator), TIGER (The Interactive Graphic EditoR), and a new Song Editor. I also use the X-or Universal Editor/Librarian and have dabbled with T-Basic (a BASIC interpreter that has hooks into all of KCS's arrays). The nicest thing about this stuff is that it can all be loaded at once via the Multi Program Environment...provided you have enough memory. Also, you can save configuration files that let you load only the modules you want when you run, which is especially painless when used with Hotwire. The software is very powerful, and I can't imagine much that can't be done with it, but there is a bit of a learning curve associated, and you need to memorize lots of commands to really get cranking with it. I have found that it is well worth the effort, however, and having an integrated software setup to run my synths is great. I would not recommend this to the casual MIDI hacker, but if you really want to get into the guts of making music, it's a great system.

UTILITIES

Hotwire/Maxifile. These two utilities from Codehead software, along with the Shareware Little Green Selector have all but replaced the desktop for me. Hotwire! lets you assign keypress combinations to run your programs, but I tend to use their menus more. It sure beats rummaging around my hard disk to find programs. Maxifile is nice on its own because it lets me do any file and disk manipulation from any program with access to desk accessories or the file selector. Used in conjunction with Hotwire, it has become my main desktop. The only weird quirk I have had with Hotwire! is that it has trouble with a couple of Emacs implementations: it will crash after running Emacs and I attempt to re-enter Hotwire! from the GEM desktop. (I have only had this problem with the Mark Williams Emacs editor and one other.) However, since I only ever get to the GEM desktop by mistake now, this is rarely a problem. Hotwire also has hooks to Multidesk, but I rarely use more than 3 DA's anyhow, so I don't use it.

As you might surmise from the last two paragraphs, I like software packages that work together as a system. Screwing around with the computer for its own sake is fun, but when I have serious work

to do, I'd just assume not have to fight with it.

COMPILERS:

I've used Megamax C and Mark Williams C, and am not completely happy with either. Megamax is nice to play with because of the Graphic shell, but pukes when you try to compile big programs (I know, the upgrade to Laser C would fix this...). MWC doesn't suffer from this, but I don't like having to learn a shell and a bunch of cryptic commands before I can start compiling. At any rate, either one will get the job done if you fight with it long enough.

GAMES:

Well...The Ultima's are fun, if time consuming (and all the fighting tends to get boring). The puzzles and quests and bad puns more than make up for it. I love the two Lucasfilms flight simulators, Battlehawks and Their Finest Hour. Great graphics, but I wish the joystick interface was better...flying a Spitfire with a mouse just doesn't quite do it for me. I do like Dungeon Master, and the old Epyx Rogue is still a favorite. The best overall game, in my not so humble opinion, is still Sundog. I would avoid Captain Blood unless you need to impress someone with the graphics. I'll stop here, because game reviews are too subjective to be useful.

THE END...

Hope this amused some of you! If anyone knows a work around for the Hotwire! bug, let me know.

Yowza,

Jonathan

4256. Does KUMA<->WERCS RSC Converter Exist?

Newsgroup: comp.sys.atari.st
Date: 1990-12-19 23:28:32 UTC
From: moses@hao.ucar.edu
Message-ID: <9617@ncar.ucar.edu>
Source record: 236276

Does any one know of the location of a resource converter utility
that will convert from the KUMA resource editor format to the WERCS
format (visa-versa)? Besides the *.RSC and *.H files produced there
is the *.RSD file that is used by the resource editor internally.
Loading a WERCS file into the KUMA editor, one loses all OBJECT name
information and some other things too.

The WERCS resource editor is the better of the two but KUMAS has some
features that are unique to it.

This is the second call for discussion on creating a newsgroup for the Boston computer Society. The name of the group was tentitively to be comp.org.bcs, but the name is up in the air so the group will not be confused with the British Computer Society. The group will be unmoderated, and will serve as a focal point for the BCS to communicate with computer users world wide. The BCS has interest groups for most PCs (both current and orphan) and many other special interest groups covering topics like ham radio to database to email.
It would be
a place for meeting notices, meeting transcripts, minutes of important committee meetings and on line newsletters to be sent and shared with all interested. In February, if the group gets created, we will possibly be able to take on line membership info....There are many other interesting things, like live meetings on line that can be done on internet and discussed in this group. If you are interested and would like to support this effort, please post your comments to news.groups with a copy to BPorter @ world.std.com thanks!

>instead of being designed as a Unix box. If you've used a Sun Sparcstation
>or a DECStation, you'll know what I mean. They don't cost _that_ much
>more than a NeXT.
Well, I've used a DECstation and I'm afraid I don't know what's
meant here. If it means that the NeXT does not use unix for the
sake of unix but for what unix enables it to do, then I don't
understand what criticism is implied here. The NeXT implementation
of unix is built around the Mach kernel. This bit of pioneering
has resulted in the usual trials associated with pioneering but
gives them a headstart on what will eventually be the mainstream
(or one of them, anyway) when OSF/1 is generally available.

Having looked at both DECstation prices and NeXT prices recently,
I believe the price difference for a working system is quite
substantial. When you consider that a NeXT comes with software
pre-loaded so it is possible to get by with just the floppy
diskette rather than the tape systems the DECstation requires, the
difference is more substantial. And when you compare annual
software maintenance costs, a DECstation is quite out of reach
for me. That's not to say that the DECstation isn't a great
machine...I love it! And DEC's a great company and I'd love to
be able to afford their support for my software. But as someone
who has looked into this recently, I don't feel that NeXT is
somehow foisting off a second-rate unix. On the contrary, they
seem to have a very well-thought out plan to which unix is vital.

Having said all of this, I should point out that I certainly
am not a disinterested party having just ordered a NeXT (but
I'm keeping my 5 year old 1040 which is still useful thanks to
many great people who post to this newsgroup).

4259. CRC problems with UNIX to ST d/loading using x,y,or zmodem

Newsgroup: comp.sys.atari.st
Date: 1990-12-20 03:06:02 UTC
From: jvance@ics.uci.edu
Message-ID: <27702A9B.105@ics.uci.edu>
Source record: 236279

Problem 1:
I have been uploading and downloading from UNIX systems to my ST
for the past few years using uuencode and uudecode to convert binary
files and then transferring them with x y or zmodem.
I have tried several times to bypass the uuencode/decode stage but
I end up with CRC errors and can never complete the transfer of an
entire file. Recently I have become very frustrated when downloading
files in the 1 meg range since uuencoded files take up lots of space,
and decoding them without a hard drive is almost too much trouble to
deal with (definately not fun even with 2.5 megs).
Kermit works, but I don't like using it with Flash (and I'm not
going to start using Uniterm) and I like the x y z protocols better.
It seems that the problem with the CRC checks has something to do
with 8 bit characters since uuencoding them solves the problem. My
guess is that there should be some way to set the UNIX host to solve
the problem, but I don't know what to set or change. When downloading
a file, the CRC error happens at the same place in that file, whether
I'm useing xmodem, ymodem or zmodem.
Does anyone with UNIX experience have a guess at what I'm doing
wrong? I'd appreciate any help and/or suggestions.

Problem 2:
Is it possible to have a reset-proof ram disk (like ETERNAL or
EDISK) working at the same time as SHADOW (also reset-proof). Can
they be written to work together (ie. can two reset-proof ramdisks
work together)? I know one can't have everything in this world but
some things would be nice.

Thanks in advance for any help you can offer.

Here's a repost of my repost on installing the JRI SIMMs board. I installed 4MB in my 1040ST. Everything works, the memory is usable with Spectre and everything else. Once in a while, the 1040 has problems booting, but if I lift it slightly off the desk and drop it, it works fine. Note that the prices I have quoted are much cheaper now, probably $35-40 or so (for the SIMMs)

---jb

Here's a summary of my recent adventure expanding my ST's RAM to 4MB using the JRI SIMMs board.

John Russell Innovations
PO Box 5277
Pittsburg, CA 94565
(415) 458-9577

I bought 4MB of 1MBx8 80NS SIMMs from some vendor (I forget) but browsing through the current MacWeek, I found the PSI ad:

PSI, Inc. (800) 622-1722, for $59.50 per MB, you defintely need low profile SIMMS. By the way, the JRI board was $125, so the whole thing can be done for about $350-400.

Here's how it went for me:

The JRI kit arrived and even included some jumper wires and some solder! There are 4 different sets of instructions that you must choose from, depending on your particular ST's motherboard (works for 520STs also, by the way). The

differences between the boards are clearly shown. I found that the instructions were a little vague about a couple of things, for example, the instructions keep refering to top,bottom,left,right sides of the shifter board when the proper orientation of the board is never shown.

Basically you have to remove 6 resistors from
the motherboard (only 3 if you're just going to 2.5MB) and put in a total of about 10 jumper wires, one of which is a pain because it is a jumper to pin 61 of the MMU, which must be soldered UNDERNEATH the motherboard and then attached to the JRI board. I had a couple of problems with the upgrade, first problem was that the jumper to the MMU that runs under the motherboard got shorted by some of the soldering points under the ST. I solved this by using electrical tape to stick the jumper to the backside of the motherboard in safe fashion. You also have to remove the Shifter chip, which is inside a square tin housing. You then put the chip on a supplied board, which then goes into the socket (thank god a socket was used!) left by the now vacant Shifter. This board has space for 2 shifter chips, which means that if you buy the optional second shifter (can get them at any Atari service place, I guess) you can get 4096 colors instead of the 512 on a regular ST (I haven't done this yet) Anyway, I accidentally plugged the shifter board in wrong, it's difficult to see what you're doing here--not much space. Next problem was that the bottom of the shifter board was shorting out with other components underneath it. I used more tape to fix this. This problem was weird because the machine worked in monochrome, but would bomb out in color. Luckily, I figured it out. Oh, by the way, I noticed the problem with the shorted MMU jumper because the machine only recognized 1MB of RAM. The third problem was where to put the board and still be able to shut the ST's case. I found the best way was to run all the wires through the shield that goes over the power supply (I had to bend the shield for this) and lay the board between the power supply shield and disk drive ABOVE the big tin shield. I put the board in a plastic bag to hopefully avoid any moisture or spill problems.

All in all, the thing works!!!
The instructions were a little vague in the areas I touched on above, and I wouldn't recommend doing the upgrade unless you are willing to rip your machine apart. A couple of times I thought I had broken my machine, but carefully going over all of the connections helped me find all of the problems.

By the way, you only need 120NS SIMMs, not the faster ones I got, but the savings for the slow SIMMs are probably minimal.

Good luck if you decide to go for it!

I recently purchased a Zram 4-D ram upgrade for my ST. I am pleased with the upgrade, it appears solid and has worked fine in the 520STFM I have it installed in, but there are a few cautions.

The company that manufacturers the board offers a one year warranty for the board if they install it. However, a warranty is only as good as the company that backs it up. Simply put, their customer service is piss-poor. When I purchased the board, I was assured the 4 meg board fit into my 520ST old style machine. I shipped my machine to california, where they proceeded to stuff the 4meg board into the machine. The machine was returned to me, and promptly failed a couple of days later. A call to customer service informed me that the 3-D 4meg board was not designed to go into the old style 520 (somehting the salesperson assured me, at WAACE in October, that it did.). I shipped the 520ST and the STFM to California, where, having forgotten my original instructions, installed the RAM chips on the top rather than the bottom of the board, thereby requireing that I take the machie to a local dealer to get the board upgraded to 4meg from the current 2.5 meg.

So, if you buy your board, buy it from and have it installed by a dealer. Don't ship it to Zubair. The entire debacle was entirely Zubair's fault (first they sold me the wrong board, then they installed(!!!) the thing, and their only offer of recompense for my trouble was that they would re-install the board for free, not even pay for shipping the things!

I find that many ST products are sold by people who may be having a hard time of it, as there aren't alot of ST's in teh U.S., and many take their frustrations out on their customers (Toad, Best Products, and Gadgets are of course exceptions to this rule, but then, I hear they're all doing quite well so they have no reason to be unfriendly...)

Great. So in the future we can expect WordUp, etc. to be supported by
a large corporation rather than somebody's basement.

Atari, you say? Just when you thought things couldn't get any worse...

4266. STEs, SIMMs & SIPs: evidence at last

Newsgroup: comp.sys.atari.st
Date: 1990-12-20 16:57:44 UTC
From: grahamt@syma.sussex.ac.uk
Message-ID: <4090@syma.sussex.ac.uk>
Source record: 236286

Here is a message, from John Hannah of Edinburgh, which gives the best information I've yet seen about STEs which are not being shipped with SIMMs. The bottom line seems to be: let the buyer beware. You won't know what's there until you take the machine apart.

From john@castle.ed.ac.uk Thu Dec 20 12:17:37 1990
From: John Hannah <john@uk.ac.ed.castle>
Subject: Re: STE's in Europe..lack of SIMMS
To: Graham Thomas <grahamt@uk.ac.sussex.syma>
In-Reply-To: Graham Thomas's message of 17 Dec 90 17:58:44 GMT
Date: Thu, 20 Dec 90 12:19:30 GMT
Message-Id: <9012201219.aa15395@castle.ed.ac.uk>
Status: OR

I can confirm that STE's are being sold with soldered-in memory - I have just received one!! The memory is in the form of SIP's ("homebuilt" by Atari I wouldn't wonder) which have 256Kb DIL chips soldered onto a small PCB. These boards have pins which are soldered to the mother board. The machine I have is a 520 STE and the mother board appears to have holes for another two SIP's - but NOT SOCKETED. The supplier claims that they have seen very few such machines and that most still have SIMMS. They point out that the only way to find out is to open up every machine since Atari have nothing clear to say on the subject.

It is all a bit of a confusing and annoying situation presumably resulting from attempts to cut production costs by not using "normal" SIMMS (or SIPS).

I suspect that many machines are now shipped in this way but we will never find out the extent of the problem until people come to upgrade them!!

John Hannah

Anyone who saw my previous comments on this will know what I think about it. I'll not repeat them - after all, it's Christmastime. Peace and goodwill to all decisionmakers at Atari.

Graham

4267. Newsgroups

Newsgroup: comp.sys.atari.st
Date: 1990-12-20 18:18:48 UTC
From: jimomura@lsuc.on.ca
Message-ID: <1990Dec20.181848.1910@lsuc.on.ca>
Source record: 236287

This message is only a REQUEST FOR COMMENTS and NOT a suggestion for a change to the newsgroups. Depending on responses, someday I may make a serious suggestion, but not now. I just want to find out what's going on and why.

I just received some messages at 'tndb' sent to 'comp.sys.atari.st.tech'. Being a new group on my system they were dumped in the catch-all 'letter.box' file that STadel creates for undeliverable messages. My first reaction was to decide that clearly I wanted to receive these messages. So I started up STadel again and tried to create a "room" for this newsgroup name. Unfortunately, STadel will not support a name this long. My peak is 20 characters. I tried the STadel alias system before and it didn't work on my version of STadel, so I can't alias the messages to a shorter named room. As such, I'm considering dropping the 'comp.sys.atari.st.tech' newsgroup completely.

But looking at the current newsgroups, the 'comp.sys.atari.8bit' group is almost completely unused. The only message I saw there today was one where a fellow with a Mac was trying to get an old 8 bit trackball to work on his new Mac. That has *nothing* to do with the Atari 8 bits anyway! Isn't it about time we got rid of the '8bit'/'st' divisions? For my own usage, I could receive messages into a 'comp.sys.atari.tech' newsgroup. Well, I have't tried it, but as far as I know that would be workable.

Actually, having watched the newsgroup for the last month or so, I don't see the point in the 'comp.sys.atari.st.tech' newsgroup at all. I haven't seen any *non*tech questions in the current 'comp.sys.atari.st' newsgroup. Since there is no "noise" in the newsgroup as it stands why do we need the new newsgroup at all? The small amount of traffic doesn't seem to warrant subdividing it.

Cheers! -- Jim O.

> Roger W. Sheppard 85 Donovan Rd, Kapiti New Zealand...

That is (partly) correct. ArcShell's alternate command line option lets
you edit the _prefix_ of the command string (f.i. "x -p " to extract
path names), but the rest of the string remains intact. Now the problem
with Yoshi's LHARC (I use v.1.1309 - the one optimized by Thomas
Quester) is that it won't understand something like "x e:\test.lzh
f:\stuff*.*". It wants to extract to the current directory and doesn't
accept the last part of the string. The same goes for creating archives,
it expects the files to be archived to be in the current directory (f.i.
"a e:\test.lzh f:\stuff*.*" won't work).
LH_CATCH changes the current dir to the desired drive+path (in my
example "f:\stuff\") before calling LHARC with a modified command line
("a e:\test.lzh *.*"). Also, you can decide whether or not to add path
names. Therefore, it is not so obsolete as it might seem :-) (I use it
daily...).
ArcShell's alt command line option might work OK with other LHARCs, but
I want Yoshi because it's the only one that has never let me down when
creating self-extracting archives (with Stefan Gross' SFX.PRG).

Try version 5. There have been a LOT of improvements from earlier
versions. Compiler works fine. Don't know if it works under RTX.
(Does it claim to?)

Postings about bugs in obsolete versions of software aren't very
helpful, nor are they fair to the vendors who go to the effort to fix
bugs and release improved versions.

4273. Working on bash for MiNT

Newsgroup: comp.sys.atari.st
Date: 1990-12-21 05:05:38 UTC
From: dstailey@gnu.ai.mit.edu
Message-ID: <1990Dec21.050538.24517@mintaka.lcs.mit.edu>
Source record: 236293

Is anyone else trying to port bash to MiNT? I have a version ported now
that is somewhat flawed, but still works. The problem lies in bash's
interpretation of control-Z, which stops jobs, but fails to register them
in the job queue. Processes or pipes started in the background, using the
ampersand, show up when you type "jobs," but processes stopped with
control-Z do not. The fg & bg builtins do not work with processes stopped
with control-Z, but the fg & bg utilities provided with MiNT will work, as will
the MiNT version of kill. I am using patchlevel four of the MiNT libs.

Bash runs in raw mode, so the interpretation of control-Z is up to it.
I am using the source code for version 1.05, using some of the modifications
my brother Ken added to his port of bash to Minix. (Herein may lie one
of the main problems with control-Z, in something that was done to glob.c.
I am looking into this as a possibility, but bash's source is astronomically
large, and the true cause may take a week or two to find.)

Outside of this problem, bash is working out really well. I just had three
invokations working as the default shells under MGR. I have modified bash
to know that it is the login shell when it is invoked as init.prg, and it
tries to read ~/init.rc. .bash_history is now history.sh, and the path
separator is a comma.

Because of the control-Z problem, I consider this port far too flawed to
even suggest releasing. However, if you are as desparate for a MiNT version
of bash as I am, I will email copies on request. You may want to hold off
though, since I am working hard on a solution.

>It won't work at all together with the DCACHE hard disk cache program.
>
>When DCACHE is installed and active VAULT works VEEERYYYY SLOOWLYYY
>and when it finally is finished ALL THE BACKUP DISKS ARE BLANKS !!!

I found the problem! It is with DCACHE, not The Vault. The problem has to do with the way DCACHE installs itself in the chain of rwabs handlers. Whenever DCACHE wants to call the old handler (for example, to pass through an rwabs call for a drive that it is not caching), instead of just passing control to the old handler, it temporarily reinstalls the old handler at the head of the rwabs chain and then traps (recursively) to the bios. The effect of this is to wipe out any rwabs handler that is installed after DCACHE. The Vault has its own caching scheme and installs its own rwabs handler. DCACHE immediately wipes it out, causing The Vault loses control of its cache. Files then go directly to floppy instead of to The Vault's cache. When the cache is finally flushed to disk, there is nothing there and the disk ends up empty.

>NO other programs has problems with DCACHE

This is not true. No program that installs an rwabs handler will work if run after DCACHE is installed. In particular, this applies to ramdisks. If the ramdisk is first in the \AUTO folder, then everything is fine, but if DCACHE is first, you'll find that the ramdisk doesn't work.

I have attempted to contact the author of DCACHE to see if he can fix this problem with DCACHE. Until then, users of DCACHE should aware of the problems it can cause with other programs.

This would be nice - the ST's graphics really haven't improved a whole lot
in such a long time. Even the 12 bit palette on the STe, as nice as it is,
doesn't compare to the 24-bit palettes on PCs with 8 bitplanes, or the Macs
and their 24-32 bit cards. I don't mind the palette size so much, but the tiny
number of bitplanes is a real drag. 12 bitplanes would be about satisfactory,
I guess. (Although I guess that makes for pretty huge color-lookup tables. You
don't *need* the CLUT if you have a 12 bit palette and 12 bitplanes, but it

makes it easier to achieve nifty color scrolling effects that way... }-)

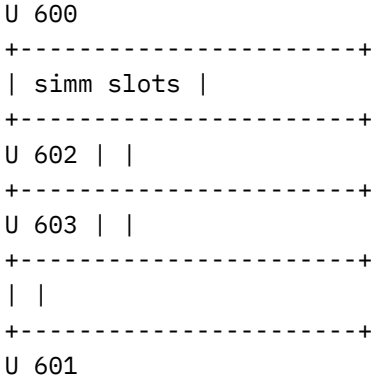
Message-ID: <4280019@hpgnd.grenoble.hp.com>
Source record: 236298

Hello,

I have a very simple question , but interesting though.
When you expand the memory of your 1040 STE with SIMM slots
(ie you have 4 x 256K SIMM modules) to a 2 Mega-byte system
(ie you have 2 x 1M SIMM modules), what are the two slots
that should stay unused among the four ?

On the board of my ST I can read near the SIMM slots :



Any ideas ,

alex@hpgndxo.grenoble.hp.com

I now have gotten the full gcc 1.37.1 cross-compiler running on our Sparc
at work, with only one exception... I can compile with the -gg option fine,
but sym-ld always core dumps when I try to creat a .sym file! The cross-compiler
seems to work great, I was able to compile gdb.ttp without a hitch, I just
can't run sym-ld on the Sparc!!!

I also patched the gemlib src to include the vdi escape sequences that it
has been missing. I guess I will need to get around to sending the diffs
into the archive in the next few weeks. This gives you v_curhome, v_curdown
etc... which wasn't in the original gemlib stuff.

If someone has a version of sym-ld running on a Sun-4, please E-mail me!!

I have been looking at libraries for use with C compilers, and have come across the Portable Math Library. Can someone tell me please the difference between PML and PML16?

4283. Phantom typist again

Newsgroup: comp.sys.atari.st
Date: 1990-12-21 14:47:32 UTC
From: wagener@max.bnl.gov
Message-ID: <2376@bnlux0.bnl.gov>
Source record: 236106

A while back there was a discussion in this group about a nuisance crash (slow death) where pretty much at random the keyboard would stop responding. This would occur most frequently while typing away in WordPerfect. Some people found (as did I) that moving the mouse a little after each keystroke would generally give you enough time to save your file and reboot.

Question: Does this occur only with a particular version of TOS?

I am encountering this problem now with WordPerfect 4.1 on a 520ST upgraded to 1 Mb and running TOS 1.2.

I have an older 1040ST at work running TOS 1.0 and I would like to know whether swapping the two would solve the problem.

Alternatively, has anybody ever found a satisfactory solution (software patch) to this problem?

And finally is there an archive someplace that saves such solutions to common problems?

Eternal thanks to the kind soul that answers my questions!

4284. Releasing The Vault Source

Newsgroup: comp.sys.atari.st
Date: 1990-12-21 15:29:19 UTC
From: fischer-robert@cs.yale.edu
Message-ID: <27921@cs.yale.edu>
Source record: 236104

I've decided to release the C source code to The Vault on a controlled basis. The conditions follow:

* You may not distribute the source to anyone else. Anyone who wants it must ask me directly, and I will supply it.

* You may modify the source code as much as you like, as long as you do not distribute the modified version of the source.

* If you wish to distribute the object code of your modified version, you must notify the user that it is a modified version. To do this, uncomment the line "#define MODIFIED" to the header file "types.h", and then modify the strings in the MODINFO dialog box in the resource file appropriately, in order to give your name, address, phone number, E-mail address and date of modification. You may distribute this modified version to up to 10 people, following the rules stated in the Licensing Agreement to The Vault, but others may _not_ distribute it.

* Whenever you distribute a modified version, you must send the source and object code to me (Robert Fischer) with a short description of what your improvements are, and I will incorporate your improvements, if I feel that they improve The Vault, in the next version of The Vault. The more modular your improvements, the more easily I can incorporate them. If you plan to do make a change which would change the underlying structure of the program, please contact me first, so that we may figure out the best way to incorporate it in the end. I reserve the right to not incorporate your change, although I will try to incorporate changes which add more features and make The Vault easier to use. As an extreme example, I would not incorporate a change which made The Vault delete files as it backed them up.

* If I decide to incorporate your source code, it becomes mine, but under the agreement that I will not sell it or make money off of it in any way. It's your responsibility that the source code you give me is actually yours to give to me. For example, I don't want to receive source code ripped off of Microsoft, use it, and then get Microsoft on my back... You retain the right to modify and distribute your changes, but may not distribute any part of the original Vault source code with them, nor may you reserve any rights to them which are incompatible with The Vault's licensing agreement. When they are incorporated officially in The Vault, they will be available to everyone as part of the object code, and to anyone who wants to see them as part of the source code.

* If I incorporate your changes, I'll include your name somewhere in the program in a way that the user sees it when asking about

information on The Vault.

* If I decide not to incorporate your changes, I will write a letter to you stating as such within 15 days of receiving them. (If you leave no way to contact you, the source code becomes mine to do whatever I want with.) They then remain yours, and you may distribute the source code to your changes, but not the original source code to The Vault, freely.

* To receive the source code to the latest version of The Vault, ask me specifically, saying you've read the Vault Alpha/Beta Tester's Agreement, version 1. My E-mail address is: fischer-robert@cs.yale.edu

By this licensing system, I hope to make it possible for many people's improvements of The Vault to be easily incorporated into new versions. I hope to prevent a jumble of versions, few of which I know about or can locate easily, each with its own set of improvements. Since there will be a limited number of modified versions circulating, all of which clearly show themselves as such, I hope to avoid responsibility for bugs in other people's modifications, and I hope that the general public will not see new features of The Vault until they are thoroughly tested by me. That way, my name on the program will tell the general public that the new version of The Vault has the same high quality as the original.

If you ask right now, please don't expect to receive the source code immediately. I'm still working on getting it to the Alpha test stage.

Does anyone want to make a non-English (i.e. French, German, etc) version of The Vault? Anyone want to translate the manual? Or do Atari users abroad know English well enough to make that unnecessary? Does anyone have experience maintaining multiple versions for different languages? I'm thinking maybe I can put all strings I use together, so that a translator can easily find and change them.

4286. Turbo C for North Americans ... what's the status?

Newsgroup: comp.sys.atari.st
Date: 1990-12-21 16:50:17 UTC
From: pavneet@klg.UUCP
Message-ID: <118@klg.UUCP>
Source record: 236112

Hi,

Is Turbo C distributed in NA? If so does anyone know if there
are English docs for it?

As a side note, I think I noticed that NeoDesk 3.0's README file mentioned
that NeoDesk was compiled using Turbo C, or maybe I was dreaming.

advThanksance.

Source record: 236105

jimomura@lsuc.on.ca (Jim Omura) writes:

- I've seen similar menus in Amiga programs. The menu bar is hidden
- until you click and then it appears at the top of the screen and
- menus drop down covering only part of the "work" area leaving the
- rest visible. This is particularly good for graphic programs of an
- artistic nature because, unlike Degas, it leaves as much of the
- "work" on-screen at all possible times.

I kinda like the way Degas does things, right button to toggle
between drawing area and commands. Any way you slice it, the Degas
method or the hidden menus you described above, you still gotta hit
something.

- If you're not an "artist" you may not realize why this is important
- at first, but if you've ever done extensive art it becomes a fairly
- obvious matter.

Well, I don't [want to :^)] consider myself an "artist," but I am
emphasizing in computer graphics and have used many drawing programs.
I've never understood the "Amiga-method" of calling up the drop-down
menus. Why should I have to hold down the right button? It's an
awkward and unusual way, IMHO, of calling the menus.

- At any rate, I like the idea generally and even though my current
- project is not a "paint" program, I would like to impliment this
- type of menu. But I've *never* seen it done in GEM/TOS programs.
- As such, I have a feeling it's probably not possible.

Nothing is impossible. I guess you've never seen any ST demos. ;^)

I have a sector editor called ZAP ST. It's interface is exactly like
an Amigas. Yes, you gotta hold down the right button to get the damn
menu up. No, I don't use it.

wagener@max.bnl.gov (Richard Wagener) writes:

- Question: Does this occur only with a particular version of TOS?

No.

- I am encountering this problem now with WordPerfect 4.1 on a 520ST
- upgraded to 1 Mb and running TOS 1.2.

Recently, while using Word Writer to type papers for finals, I got
the phantom typist. Luckily, I was able to still save the document.
It seems that the input via the mouse and keyboard is delayed a lot.
I found that moving the mouse then hitting a key would make the mouse
move a little faster than just moving it without hitting a key. BTW,
this was on an STe with TOS 1.6 and one meg.

- I have an older 1040ST at work running TOS 1.0 and I would like to
- know whether swapping the two would solve the problem.

I had the same problem on my 1040 with TOS 1.0, and this is where I
first used my roundabout solution.

- Alternatively, has anybody ever found a satisfactory solution
- (software patch) to this problem?

Not me.

- And finally is there an archive someplace that saves such solutions
- to common problems?

I'd suppose the monthly posting for the intro to c.s.a.s would be as
good a place as any.

On a related note, I heard either here or somewhere (little aliens
coming down and telling me) that TOS 3.01 (on the TT) is basically a
complete rewrite of TOS. I wonder if the phantom typist would strike
on it as well. On the other hand, there was the possibility that the
problem is in the keyboard processor. Does the TT have the same
keyboard processor as in the ST?

neil@cs.hw.ac.uk (Neil Forsyth) writes:
>Is that still any reason not to release it for the ST? ST users, Codehead
>and Double Click all want it released.

That has nothing to do with what I said. I said that if ENS thinks the
TT Desktop is "disappointingly similar" to the ST Desktop, then he
probably hasn't really looked at it and hasn't read the manual.

On the subject that you bring up: similarity to existing third-party
products is not a reason that the "new Desktop" isn't available for
ST's. And what's this about "Codehead and Double Click all want it
released?" What difference does that make?

In any event, the "new Desktop" is not available in any RAM-loaded
version at this time; it's only available in TT and Mega STe ROM TOSes.
If you see a RAM-loaded version of Atari's Desktop, it's an illegal
copy of Atari propietary material and furthermore should not be trusted
to be reliable.

Put your Simms into the First 2 slots, that is from the Front of the machine, It is posible to use 2.5 megs, there have been posting that this does not work, but I have seen it working, I don't know if the 2 megs was in the Front or the back, but 2.5 megs does work on a UK STE, and with out a Patch program...Please note Simms don't pull out , they pivot them out to say 30 degrees, and just lift them out, no pulling at all
Note: you can use 9 bit simms, these have a better resale value, get the fast 70ns ones, only do this if you intend to use them in a PC..
The Atari only need 8 bit , 150ns, the other bit in the 9 bit ones is wasted, but then they could be used in a PC. Just a thought....

Well, I can answer part of my question: it seems that
smartdrive.sys is the problem. When I include smartdrive.sys
in my config.sys file, the machine does not boot. When I
don't include smartdrive.sys, everything is OK. So, now the
question becomes: is there any way to run smartdrive.sys? is
there some way to get the same effect as including it in the
config.sys file? Any help would be appreciated.

sun4 (SPARC)
vax_bsd 4.3

Among other APL software there are two fonts (or folios). One, called
"APL2741", is a postscript line font, derived from scanned images from
an ancient 2741 golfball terminal equiped with an APL typing element.
The other is an X-windows font.

It is hoped that eventually there will be a mail server for the same
range of software to those who have e-mail access but no ftp access,
but a userid for this mail service has not been announced yet.

Currently, this service is being provided on an experimental basis, and
there are no promises that it will continue on a long term basis. Nor
is there any warantee of serviceability or completeness of the software
distributed there.

4304. X-former cable pin-out

Newsgroup: comp.sys.atari.st
Date: 1990-12-22 22:22:34 UTC
From: Yonderboy@cup.portal.com
Message-ID: <37166@cup.portal.com>
Source record: 236125

Hey, could some nice net-person post or e-mail me the pin-out for the X-former cable? (Atari 8bit disk drive to Atari ST interface).. I got a pin-out, built the cable and it doesn't work! I have two programs that could utilize it but it just plain don't work and it seems to be a simple cable and I am 99% sure it is not anything I did wrong...

Your "peak" is broken. Fix your software, or complain to the vendor.
There's no real valid reason to change a set of working newsgroups,
especially for software broken like this.

For those who are interested, a list of all newsgroups with >20
character long names are included below the signature. Note, that
"comp.sources.atari.st" (and the binaries group, of course) both fit in
this category also.

4306. HD (1.44 meg) drives for 1040ST

Newsgroup: comp.sys.atari.st
Date: 1990-12-23 03:58:16 UTC
From: zeitler@esseye.UUCP
Message-ID: <1990Dec23.035816.11183@esseye.UUCP>
Source record: 236126

Will the IBM PC 1.44 meg drives work just by plugging one in place of my old 720k 3.5" drive in my 1040STf? I never thought I'd need one after getting the Syquest, but I find I need compatibility with my laptop which uses the high density drives.

Thanks in advance for any help.

Dave Zeitler

I think there was some discussion here last year about this, and it was found
that the latest series of Rom for the 296N had been deliberately slowed down
by Seagate so that the drives would work with Macintoshes. I guess Apple ordered
a lot of them and the Mac couldn't keep up to the original transfer speed.
Someone tryed to get the old Roms from Seagate, but no luck.

4312. Re: Phantom typist and Timedrv5 (Was: 1s

Newsgroup: comp.sys.atari.st
Date: 1990-12-23 15:00:01 UTC
From: jhenders@jonh.wimsey.bc.ca
Message-ID: <A0qnz73s@jonh.wimsey.bc.ca>
Source record: 236131

I don't think you're dealing with the Phantom here. There's another
bug which, if I remember the explanation corerectly, strikes the keyboard
chip occasionally. It happens when the kb chip misses the key-up part of a
packet. It shows up a lot for me on boot up since I got a Golden Image mouse.
If I move the mouse quickly while the St's booting, I get escape key messages
continuously. Hitting any key ends it. Maybe timedrv is doing something which
interupts the kb chip while it's waiting for a key up message,

>understand your implicit criticism of it.

Sorry. This was not intended to be a criticism of either VAULT or DCACHE.
I am sure both are fine programs, but I have used only one, with no
complaints. My criticism, if there was one, was implicit indeed, and
would be more precisely aimed at the absence of a central direction or
control in the development of software. I suspect that many users have
found instances, as I have, of software, each one fine by itself, which
clash with each other, because of assumptions made by the author. In
some case *I assume* that these programmer assumptions include making
use of so called "illegal" locations in the system. I do not wish
to impune the integrity of any author here. I am sure that each
does the best that she/he can with what is at hand, and I am grateful
to a number of authors of fine software for the work that they have
done.

Again, sorry.

Here is an excerpt from the output of ";known floors" on the MAST
BBS (Minnesota Atari ST users).

[Port Atari]..... ctdl.sys.Atari.ST)* comp.sys.atari.st:* Atari8:*
comp.sys.atari.st.t:*
^
|
As you can see, the newsgroup name is truncated, but
works. For further info, contact Tom Cook, sysop of the
MAST BBS, at "tacook@moundst.mn.org".

Aliasing works, too, although the docs are confusing.
The room "ctdl.sys.atari.st" is so named at MAST for the
benefit of neighboring sites that receive it via UUCP.
Most Citadels call it simply "Atari ST."

> But looking at the current newsgroups, the 'comp.sys.atari.8bit'
> group is almost completely unused.

Yup. 8bitters are history. Like it or not.

> Actually, having watched the newsgroup for the last month
> or so, I don't see the point in the 'comp.sys.atari.st.tech'
> newsgroup at all. I haven't seen any *non*tech questions in
> the current 'comp.sys.atari.st' newsgroup. Since there is
> no "noise" in the newsgroup as it stands why do we need the
> new newsgroup at all? The small amount of traffic doesn't seem
> to warrant subdividing it.

Heh.... stick around. Noise? You'll see plenty of it.

comp.sys.atari.st periodically goes through horrid bouts of flaming,
bickering about Atari Corp.'s marketing policies, etc. Such

posts are explicitly forbidden by the charter of the tech group.

comp.sys.atari.st also is open for discussion of applications and games, which .tech is not.

Conversely, chatter about programming dialog boxes properly belongs in .tech, where it won't scare off the less technically inclined.

Returning to the matter of STadel and BBSing:

cmc@overmind.mind.org in Atlanta and Adrian Ashley up in Canada (sorry, Adrian, but I can't recall your net address) have source code to STadel and have developed their own mutations, Fortress and <fnord>adel respectively. Bob Lee at Time Arts (the Lumena people) also has his own version, called b0badel, but I think it's only for PCs. Any of these folks can fix the roomname-length bug. A related bug/feature commonly truncates very long user names; I hope that one gets fixed, too.

The author of STadel*, David Parsons, no longer is working on it, but is developing a portable BBS called bauble. You can contact him at "orc@jazz.sybase.com" or "akcs.orc@vpnet.chi.il.us".

*STadel originally was the Atari ST version of Citadel. It was ported from Citadel-86, which was HAW's PC version of a program that originated under CP/M. STadel later was ported back to PC-DOS and also to Amigados. The Lake, now a UUCP system, originally was "The world's second Atari ST Citadel," so I know about these things. :-)

Steve Yelvington / P. O. Box 38 / Marine on St. Croix, MN 55047 USA

Re: Compression.

I agreee there should _never_ be compression on backup files. I use Diamond Back for the ST and until yesterday used Fastback on the PS2. I used compression on Fastback and you guessed it the jolly thing screwwed up so I went to restore my files and my fastback died. So I went to the dealer to get another copy of Fastback and wouldn't you know it I still can not back up my PS2.

So the moral of the story is just standard backup technics. I love Diamond Back and also Mega-a-minute I recommend them to any one with large drives they need to back up.

Hi Netters.

I am looking for systems that have access to them via X25/X32 and X400.
I am compling a list for the users here that access us via PDN so they can
call other systems world wide via PDN.

Can you please supply information in this format if possible.

Name : STaTus BBS [system name]
PDN : 9500001313 [PDN access number]
DNIC : 05301 [the countries address]
Carrier: PacNet [The countries PDN service]
Type : X25 or X32 [If known the type of system]
X32 No.: N/A [The X32 dialout number ditto X400]
Other : Atari BBS [any notes you want to write]

Thanks in advance for this. Please include any local systems you may know
of as they may not be known elsewhere.

Hi Netters,

I am looking for a Fido HUB for the Atari feeds close to New Zealand. Does anyone in Australia or Asia have a feed. I know there is one in Israel which is the same cost to call the USA.

If some of you know of any hubs can you email

Also do any of the HUBS use PEP modems at 19.2k if so this will be a cheap call for us. Or do any of you have PDN access at all this may be an other alternative.

Thanks in advance and MERRY XMAS. Jon Clarke

What the HACK is this ???

CONS-FIX 1.3 is *my* program, i am the author of it. It is not in BETA-
test state, it is doing it's job (Fix TurboST/QuickST-redirection
problems to console if you use GEMINI or other shells). I distributed
it as freeware together with GEMINI 1.2 and in the FIDO-net. You can
download it from atari.archive (with german documentation), from every
big fido-node (it went around europe with stick/hatch) and every MAUS-net
box in germany.

4327. ST Format, EuroNet BBS system's

Newsgroup: comp.sys.atari.st
Date: 1990-12-25 10:39:28 UTC
From: STT@kcbbs.gen.nz
Message-ID: <1990Dec25.103928.23598@kcbbs.gen.nz>
Source record: 236147

Hi chaps,

I am answering a message left in the December issue of ST Format an English Atari magazine. So anyone knowing Andrew Hutchinson please post this to him on the net as I am not aware of his EMAIL address.

Andrew, you have asked for sysops to email / snail mail you. The snail mail is in the post but what with the xmas rush I guess it will take a while to hit the UK.

We run a BBS here in Auckland as the header and trailer of this messages suggests. I would like to know more about access into EuroNet and carring the ST Format information on our BBS down here. I already carry several USA based on-line Atari Magazines and snippets from 'CT' in Germany. So it would be a bonus to our users to have an english input in this area.

Re: your comments in the December issue. Sorry I have to disagree with your comments re CI$ as GEnie is by far the biggest Atari Base in the USA and to my knowledge in the modeming world. For this matter with the new Star services GEnie has it only costs $us4.95 a month for all your online time. A lot cheaper than what you quoted for Compuserve as you will agree. GEnie can be accessed from 158 countries world wide via P.D.N and if you would like the NUA I will be happy to email/snail mail it to you in the future so you can pop on and have a look.

Re the ammount of files available in the USA I might add we have over 85000 PD files on our BBS here in Auckland all with free access for our users to download. Over 1/4 of these are Atari ST files.

A quick overview of the BBS as per your request.

[a] Hardware : Mega 2
330 of hard disks
1.2 gigs on cd rom [2 cdar504's Atari cd_roms]
Multi-line/node up to 19.2k in PEP
CD_Port for multi serial lines
[b] Software : MichTron Version 3
[c] Other : Full Usenet [as per this message]
on-line magazines
PDN access NUA is 05301 9500001313
{to Paxus FaxNet [nz free dial tie lines/ no tolls]
Atari-NZ / AUA support on-line
FREE PD ordering from USA for the users
VT52/IGS/ascii menus supported

EMail and Document [fmail] exchange
[soon as the node number arrives Fido Net mail]
[d] Fees : NONE a totally free BBS
donations _NOT_ excepted

Hope this helps Andrew. Please if you are on the net email me or on one
of the services below.

Email : Jon_Clarke@kcbbs.gen.nz or STT@kcbbs.gen.nz
Compuserve 72000,3555

You're right. I didn't look at the manual or the desktop carefully. The
new desktop really is much better; I especially like selecting the
top window as default when a program is run from a desktop icon. You
can't tell a book ...

Here's a vote for releasing a RAM based version of the new desktop
for ST's so all the ataris in our lab work the same way.

4331. letter to byte

Newsgroup: comp.sys.atari.st
Date: 1990-12-26 16:02:37 UTC
From: tellabs_canada@canrem.uucp
Message-ID: <1990Dec26.1113.4336@canrem.uucp>
Source record: 236207

Alright fellow North American ST users:

Only recently, Byte magazine (North American Edition) featured an article on Desktop Publishing systems for various computers, and failed to even mention the Atari ST.

We all know the ST is underrated as a DTP platform - it's as though BYTE were writing a comparison of MIDI software and neglected to mention the ST - so now's our chance to speak up for our system.

This mass mailing has been organized on the FNET, and the letter which follows is a personalized version of a skeleton letter posted to the FNET for all to use. I know you may think your letter is a puff in the wind, or that everybody else will send so why should you; but you must realize that _your_ letter _can and will_ make a difference. Cast your "vote" for the Atari ST in a forum where you'll be heard:

Below is a copy of the letter I'm mailing. I will be going to work, and I'll be dropping it in the mail-box just outside the building. Its only costing me $0.42 (it's not proofed yet - please don't email me about any gaffes you find ;)

--------------8<--------cut here-------8<---------------------

December
26, 1990.

Attn: Fred Langa, Editor in Chief
One Phoenix Mill Lane
Peterborough, NH 03458

Dear Editor:

I am writing in reference to your comparison of different Desktop Publishing packages featured in the October 1990 issue of Byte, and to express my dissapointment and frustration in your complete failure to mention the Atari ST computer and its tremendous DTP abilities.

I have been a long time Atari ST owner and reader of your magazine, and I was very disturbed to find that your October article completely ignored the Atari ST in its otherwise well-rounded comparison. This editorial decision continues your long standing tradition of ignoring the Atari ST, even in areas where the ST excels.

[***this is my personalization - please remove it from your own***]

Perhaps I should mention what experience I've had with Atari Desktop Publishing software - I have used an Atari ST for DTP work

since 1986 when I purchased a copy of Timeworks DTP to create advertisements and newsletters for a local community group. Since then, I have switched to Calamus, the premier ST DTP package, for work as ambitious as the creation of a 350 page GEM C programming text. Beyond my experience on the ST, I have used Quark Express on the Macintosh and have become quite familiar with Ventura on the IBM. Though these programs demonstrate some strengths over Calamus in some areas, I've always preferred Calamus for its unmatched printing speed and 100% true pixel to print raster correspondence (i.e. you can magnify a document in Calamus to obtain a true pixel-by pixel representation of the printed output). Raster images are actually created within Calamus and sent to the printer directly, bypassing Postscript. I have never been "surprised" by Calamus' output. To top it all, I have also enjoyed on-screen scalable outline fonts through Calamus for years- long before such display schemes were realized on Macintosh systems.

[***the skeleton resumes here, keep stuf from here on in***]

Although the Atari ST has been available for over five years, the
coverage that you have given it has been minimal. While I realize that the number of Atari ST's sold in the United States can not compare with that of the IBM PC or Apple Macintosh (although this is not true world wide), it is unfair to the people who own Atari ST's, or people who would like to purchase a system that is different then the above mentioned computers that you continue to ignore this 68000 based computer. How can a consumer make the right computer buying decision if they are not given all the facts about the systems that are available to them?

Now I know it would be silly to expect to see the same amount of coverage that the IBM or Macintosh receives. I would still hope that major software applications, such as ISD's Calamus or Outline Art, Soft Logik's PageStream, Wordperfect for the ST, Goldleaf Publishing's Wordflair, Borland's Turbo C,Migraph's Touch-Up, or the many, many other software packages, not to mention hardware upgrades such as Gadgets By Small's Spectre GCR Macintosh emulator, Talon Technologies' Supercharger IBM emulator, ICD's Advantage Plus hard drive controller, Fast Technologies Turbo 16 accelerator, or Moniterm's 19" monochrome monitor, receive a fair and accurate review as would other software and hardware packages for other platforms.

You may not realize that nearly 1 million ST's have been sold in the United States, and nearly twice that number in Europe. Your magazine would certainly see increased sales were you to dedicate a

Message-ID: <1990Dec26.1113.4337@canrem.uucp>
Source record: 236208

You may not realize that nearly 1 million ST's have been sold in the United States, and nearly twice that number in Europe. Your magazine would certainly see increased sales were you to dedicate a monthly column on the Atari ST and provide a much needed coverage of a fantastic computer to users and prospective buyers who are in need of truly objective information.

While I will continue to purchase your magazine in the future in hopes that you will begin coverage of the Atari ST as you do the Amiga and the other systems mentioned, I encourage you to give fair and accurate coverage to the Atari ST line of computers. I do hope that you will give Atari's new computers, the low-cost 32MHz 68030 based TT/030 and 16MHz 68000 based Mega STe, the same coverage that you have given the Macintosh, Amiga 3000, and NeXT computers recently. There are hundreds of thousands of Atari ST users waiting to purchase a magazine that covers the ST. Please consider including the Atari ST in your magazine.

Best Regards,
Mark Onyschuk

4333. Re: GNU (as it applies to the ST)

Newsgroup: comp.sys.atari.st
Date: 1990-12-26 19:12:58 UTC
From: apratt@atari.UUCP
Message-ID: <2789@atari.UUCP>
Source record: 236213

Yonderboy@cup.portal.com (Christopher Lee Russell) writes:

>I have read a little about GNU. I thought that GNU was suppose to be an
>alternative to UNIX that was being developed to be free. Anyways, I have seen
>alot of stuff on atari.archive and panarthea that say GNU-this and GNU-that..
>What exactly does this mean? Is there a versio of GNU running on the ST?

The things which are widely available for the ST from the Free Software
Foundation (aka the GNU people) are the compiler and some related utilities.
GNU itself is, as you say, a UNIX-workalike OS, but anything from FSF
is called "GNU this" and "GNU that" -- GCC is the GNU C Compiler, GNU Make
is (obviously) make, GNUUCP is UUCP from FSF. And then there are tools that
do NOT have GNU (or even G) in their names: Bison is a yacc replacement;
flex is a lex replacement (which may not be from FSF at all).

All FSF software is covered by something called "copyleft" -- it's a
copyright, and some terms under which you can use and distribute the
tools. It is stated in a file called COPYING when you get most anything
of theirs. Briefly, it states that you are allowed to use it, and you're
allowed to give it away, and you can't deny anybody else's right to use
it or give it away. It also covers the source code: if you give away
FSF stuff, you have to give away the source, too, or hold it available,
or let the person you give it to know where you got the sources, so s/he
can get them from there, too. This is a simplification, but it should convey
the general idea.

The chief confusion I have run into about copyleft is what's covered.
The compiler and tools are covered. Programs you write using the
compiler are not: you can charge money for them, hoard the source code,
etc. This is limited by the status of any library you link with, but on
the ST the libraries are explicitly PD. Bison is a special case,
because a parser generated by Bison contains FSF source code which GCC
in turn compiles. Therefore the parser, and any program containing it,
contains FSF source code and therefore is covered by the copyleft.

>Anyboy in Net-land using Minix on there ST? I read an article in BYTE mag.
>about it and it sounds really good. Does the St version do all of the stuff
>that the IBM version does (for example does the ST version come with a C
>compiler, etc) ......Yonderboy@cup.portal.com

Yes, lots of people use Minix. Try bammi@cadence.com,
ersmith@uwovax.uwo.ca, and comp.os.minix. I don't happen to use Minix.

4334. Wanted: Trak-Ball

Newsgroup: comp.sys.atari.st
Date: 1990-12-26 19:22:32 UTC
From: poirier@ellerbe.rtp.dg.com
Message-ID: <1990Dec26.192232.24160@dg-rtp.dg.com>
Source record: 236201

Wanted: One Atari Trak-Ball, to be converted for Amiga use (or, perhaps one already so converted), described as follows (I quote):

"The device
in question is black and roughly rectangular and is labelled across the top "ATARI TRAK-BALL". In the rear there is a cutout which contains a JS/TB (joystick/trakball) toggle switch, and the strain relief for the cord. On the bottom are 4 rubber feet which conceal recessed screws. Also, there is a paper label which on mine reads "KM483" and below this "8". Below this label is stamped "MADE IN USA". On the top left and top right of the top surface are two black fire buttons shaped liked truncated triangles."

My apologies if this is not the appropriate newsgroup -- I really don't know which Atari system this Trak-ball was made for.

Reply by email to poirier@dg-rtp.dg.com please.

Cheers,
Charles Poirier

Source record: 236203

If you just plug a hd-floppy drive to your st, it will work, but only
in dd-mode. To get it work in hd-mode, you'll have to get a hd-adapter.
These adapters are available at least from Hard & Soft A.Herberg, which
is in Castrop-Rauxel, a place near Dusseldorf in Germany. To work correctly
this adapter needs the WD 1772 floppy-controller chip, check if your ST
has this one. (some won't)
To connect this firm, get a magazine (german) called 68000er STmagazin,
or send me email to get the address, part-nr and price.
I am not connected to this firm any way besides being a customer!

That magazine is really worth getting, because it helps you to contact
to the makers and shops of the most exotic hardware that is available to
the ST/Mega-serie.
Not connected with STmagazin either!

From: koreth@panarthea.EBay.Sun.COM
Message-ID: <712@grapevine.EBay.Sun.COM>
Source record: 236206

I've made a minor change to the archive server. There is a new command.

id word

in a request will put the "word" in the Subject line of the server's reply.
This is useful for people who make several requests and want to match the
replies up with the requests easily. The word can't contain spaces (a bug;
it'll be fixed eventually.)

Also, just a small administrative note: the submission queues for the
comp.sources.atari.st and comp.binaries.atari.st newsgroups are now empty.
If you've been waiting to submit your fancy new program, this is the time!
(If you HAVE submitted a program and it hasn't appeared yet, it was probably
lost somewhere between your site and mine.)

You didn't really mean to say this, did you Jon..?

GEnie charges $4.95 a month just to use the service... everything else
that a normal user would want to access is extra cost, at $6.00/hour.

Even those Roundtables that are included in the Star*Services flat rate
DO NOT include downloading... you can read all the messages you want
in the Scuba Roundtable, for instance, but if you want to download any
underwater pictures, the meter starts, and you pay $6.00/hour.

ALL the computer-specific Roundtables cost $6.00/hour for everything...
messages, conferenceing and downloading...

4341. Formatter for single to double

Newsgroup: comp.sys.atari.st
Date: 1990-12-27 04:04:33 UTC
From: thaanuj@prism.CS.ORST.EDU
Message-ID: <1990Dec27.040433.21680@usenet>
Source record: 236210

I know that somewhere I heard about a utility that formats just the back sides of single sided disks, leaving the front half of the disk intact. When I bought my used ST, it only had a single sided drive, but I have long since bought a double sided as well. I still have a lot of single sided disks I would like to use both sides of without having the tiresome task of copying them to double sided, reformatting the disk, and copying them back.

If any of you folk out in netland have heard of this beast, please give me a holler and point me towards it. A casual glance through the index at atari.archive gave me no clues, perhaps it is a commercial product I am thinking of. Anyway, thanks in advance, and may you have a great 1991.

4342. ST Stuff Reprise Reprise

Newsgroup: comp.sys.atari.st
Date: 1990-12-27 04:12:53 UTC
From: lbert359@pallas.athenanet.com
Message-ID: <491@pallas.athenanet.com>
Source record: 236211
Cross-posted to: misc.forsale,comp.sys.atari.st

Most of the Atari stuff I posted for sale here is already spoken for.
A lot of it has been shipped out, but I am still awaiting money from
many of you. In particular, #'s 4, 10, 11, 15, 17, 18, 20, 24, 25, 27,
28, 30, 31, 46, and 47. It is probably safe to assume that since you
could not get all of the items you requested, you decided not to get
what was left for you. If this is not the case, please let me know
as soon as possible. After January 1, I will repost with those items
still not claimed.

The person who claimed the 520 ST has informed me that he cannot take it,
so it is back on the market. $150, includes single-sided drive, mouse,
power supplies, cables. All you need to do as add a monitor and software.

I have also come up with a Mega2 and a Mega4. Will entertain offers for
these machines. The Mega4 is out on loan, and expect to get it back within
the next two weeks. No mice, monitors, or software.

>
>Well, I don't [want to :^)] consider myself an "artist," but I am

Yeah. I can tell you're not an artist. No insult intended
but no *real* artist -- ie person who is seriously trying to create
a work of art, would agree with you unless they were strangely
perverse. It is the drive inside the individual to create that work
that *forces* an artist to draw or do whatever s/he does. If you
don't have it, it's not likely you'll ever become an artist. I'm
thinking in particular of some of my freinds in that regard more
than me, though in some ways I'm "driven" too, though in different
directions. That's not to say that it's impossible to create a great
picture with Degas, for an artist you're working against the program
rather than with it. It's like this: You're standing in front of
your canvas with your "assistant" sitting beside you. Every time
you want to change colours on your brush or think about picking up
a different brush, he throws a blanket over your picture. . . .

Then again there was the disappearing cursors. That was another
"classic feature" of Degas. Degas was a "passable" program at a
time when the only other program on the market was Neochrome. I
hated Neochrome even worse, though thankfully, it's been so long
since I used it that I've actually forgotten exactly what it was
I didn't like about it. Hey Neato!!! A bad memory has its compensations! :-)

Anyway, CyberPaint is the best program I've tried on the
ST so far in this regard. Deluxe Paint may be better, but I
haven't gotten around to trying it yet.

>I've never understood the "Amiga-method" of calling up the drop-down
>menus. Why should I have to hold down the right button? It's an

With CyberPaint you don't "hold down the right button." You
just click it to bring the menu bar up and click again to get rid of
it. This is the best user interface for artwork that I've seen
so far -- as I've said before. In fact, it's so good that I
obtained Jim Kent's permission to copy the whole CyberPaint user
interface for a paint program on another computer. That's an
interesting story. I actually finished that program and it works.
Jim Kent has a copy of it. Unfortunately, the computer I wrote it
for was marginally popular and the negotiations for the distribution
of the program died. 9 months of work went down the drain. Life'ls
like that. . . .

>awkward and unusual way, IMHO, of calling the menus.

On the one hand you say you've used lots of paint programs.
Yet you obviously don't know how CyberPaint works. And with
that in mind you certainly feel yourself qualified to extoll
Degas? Come on now, think a bit before you post!

>Not connected with STmagazin either!

I seem to recall someone posting a rather lengthy message a few months
ago which went into graphic detail on how to connect a HD drive to an
ST. The most exotic thing it requires is for one to double the clock
speed of the floppy controller chip. I believe it was Rainer Klute who
posted it, so you might want to ask him.

Cheers,

Chris

p.s. Oh yeah, just to piss off Stephen Jacobs, Atari stock closed at
1 7/8 yesterday. That is roughly 1/3 of it's value 5 months ago.
Smiles everyone! :-)

>We all know the ST is underrated as a DTP platform - it's as though BYTE

Yes, and we all know that there really aren't enough ST's out there to warrant Byte's attention. Didn't Computer Shopper drop the ST coverage for this reason? (Or was it that there just wasn't much new stuff to write about? I've forgotten which...)

>were writing a comparison of MIDI software and neglected to mention the
>ST - so now's our chance to speak up for our system.

I think you're wasting your time. Writing about ST's isn't going to earn them any significant increase in readership due the the relatively insignificant number of STs in the US (compared to PCs and Macs). Also, I really don't think any producers of ST goods would advertise in Byte on the off chance that Byte published a paragraph or two on the ST in each issue (they would probably opt to use one of the ST-specific rags instead). Therefore, Byte would probably not earn any significant amounts of money from paid advertisements. Byte is in business to earn money. Covering the ST would seem to be a lose-lose situation for them.

>FNET for all to use. I know you may think your letter is a puff in the
>wind, or that everybody else will send so why should you; but you must
>realize that _your_ letter _can and will_ make a difference. Cast your
>"vote" for the Atari ST in a forum where you'll be heard:

Well, I don't think Byte would change its format to suit a few cranky ST users. The magazine seems to be doing just fine as it is and I suspect they will have a very "if it ain't broke, don't fix it" attitude towards ST coverage.

[letter deleted for brevity]

Someone posted here saying that he runs a 296N at 1 to 1 interleave
with a BMS host adaptor and gave a short explanation of why there's a
problem. I called ICD to see what their story was, but got an
irritat{ed _and_ ing} guy who said there's no problem, sometimes it
works with 2XXNs and sometimes it (1 to 1 formatting) doesn't. He
hardly let me get a word in edgewise and wouldn't even *consider*
investigating, let alone making the ICD adaptor work with these drives
that barely meet the SCSI specs. Such a pity, the ST end of ICD HAs
is superb, long cable with optional write verification (that I use)
and a great cacheing driver. We'll get an update soon from Vance
Chin, as I am getting BMS' Host Adaptor info sent to me.

I am tired of conflicting programs too. Those reviews that people
(myself included) should be writing for c.s.a.st and atari.archive
should include compatability testing. I would also like to read
reviews of peoples' working systems that *do*not*conflict!

On a related topic, is it too much to ask for people to write single purpose programs? The glut of "everything but the kitchen sink" stuff means I can't pick the best, or I have to waste precious memory with DAs that duplicate functions.

Message-ID: <4376.277a565a@cc.helsinki.fi>
Source record: 236216

Hi!

Is it possible to use 2 hard disks (MEGAFILE20 and SH205) and the Atari SLM804 laser printer at the same time on a MEGA4? The printer has worked fine on my MEGAFILE30/MEGA4 setup but we couldn't use two hard disks on my friend's configuration. What should we do?

Jouni

4349. Re: editors: VI, EMACS (also PBMplus)

Newsgroup: comp.sys.atari.st
Date: 1990-12-28 01:14:13 UTC
From: rosenkra@convex.com
Message-ID: <1990Dec28.011413.9285@convex.com>
Source record: 236219

first, some info i was not able to mail to some people...

after posting mgif, i received several requests for PBMplus, which i mentioned in the README file. as far as i know, there is no full port of PBMplus to the ST, though it should be fairly simple with gcc (32-bit mode). it runs mostly on unix boxes as far as i know. it was posted to comp.sources.unix (or comp.sources.misc, i forget which) and should be available on one of the archive sites for these groups (e.g. uunet.uu.net). in addition, there are periodic additions to PBMplus which appear in alt.sources, too. i do know that there is support in PBMplus for GEM files (i THINK these will be degas-ish pi1, pi2, and pi3 files). PBM plus has its own formats for color, grayscale, and other images and can convert between a whole slew of other formats and do lots of image manipulations. it is a very nice package (and i wonder why it has not been ported to the ST, at least parts of it). it is rather large (several MB of source, as i recall).

on to other things...

In article <37252@cup.portal.com> Yonderboy@cup.portal.com (Christopher Lee Russell) writes:
>There are about a thousand different version of VI and EMACS on the lists
>of Panarthea@sun.com and Atari.archive... Does anybody have any opinions
>about which ones are best..

opinions? i got a million!

i have most of the zillion versions, collected over the years. i am an emacs user, so naturally i prefer emacs (no flame wars on this...PLEASE!!!). of all the emacs' out there, i prefer MicroEMACS, v 3.9n (i think i use "n"). i have 3.10something, but it no longer prints the status line in reverse video, and it does not seem to offer more than improved mouse support, which i don't use anyway. GNU emacs would be very attractive, but i could not get it to run because it insists on having the termcap file end in newlines (NOT cr-newlines, as is the convention with TOS/MSDOS text files). that was quite a while ago, it may be "fixed" now. an added plus with GNU emacs is the ability to use special elisp files to add new capabilites. this is possible with MicroEMACS as well, though if u use GNU emacs on another system, then u have little compatibility problems. both come with source, so u can always "fix" things to your liking. i have edited files larger than 150k bytes with microemacs with no problems. note that microemacs lisp is NOT the same as GNU emacs lisp. someday, i'll set up a drive just for all the GNU software, so i will probably end up with GNU emacs, if it is not too big, even for my mega4 (which normally i have going with a 2 MB ramdisk).

[incidently, if someone can tell me how to get the status line in rev video
with MicroEMACS 3.10, i'd appreciate that. without a recompile, that is,
since i believe i would have to port it to Alcyon (SHEESH!!) or get gcc
up and running.]

i prefer emacs because of its language context sensitivity (in C and fortran
though i write very little fortran on the ST) and because at this point in
time, it is everywhere, at least in the unix world (what other world is
there? :-). by "everywhere", i mean most pcs (generic), workstations,
supers (yes, even cray :-) and minisupers, all the systems i am likely to
encounter for the next 100 years. the argument that vi exists everywhere
compared to emacs is no longer a valid one, IMHO.

it takes a bit longer, perhaps, to learn emacs (say 20% longer), but IMHO
it is a superior editor for programming. so if u are just learning an
editor, i'd recommend learning enuf of both vi and emacs (say 10-15 commands)
then pick one you feel more comfortable with and do most of your work with
it. vi is modal, too, in that there is an "input" mode and a "command" mode.
i personally hate that (there is no key marked "Esc" on a DECstation 3100,
for example. Esc is used to terminate "input" mode in vi. that does not mean
vi is bad, more probably it indicates DEC is not serious about unix. PLEASE,
no flames on that either! except from ken olson hisself :-).

of the various vi clones, i have made stevie 3.65 (or perhaps 3.95?) what
comes up when i say "vi file", though that is about twice a year, so ask
someone else about vi. it never bombed on me (i think elvis had some
problems, at least the early version i got). elvis seems to be the prefered
vi for Minix, though Minix itself has these limits on executable sizes,
at least on the PC version (64k text + 64k data) which can severly limit
what u can do.

enjoy...

There is a possibility to connect up to 14 HDs and a laser to ST...
All you need is to check the DMA id numbers of those devices.
My system has 2 HDs DMA 0, units 0 and 1 and a laser as DMA 7.
Those numbers are easy to check using a SCSI-software that normally comes
with HDs (non-Atari ones...).
SLM 804 usually is DMA 5 or 7, depending of it's age.
Setting those numbers...refer to the manual of that device.

Thanks much for the replies (both posted and email). I had hoped that a 10 minute switch to a cheap high density drive would solve my problem with numerous disks of differing format floating around. Looks like I'll wait until the problem gets more painful. For now, I'll continue hauling a couple of these low capacity (? seems I used to consider anything over 100k high capacity) 720k disks with the laptop to share data.

I recently acquired a Philips CM110 SCSI CD ROM player. Any hints on how I can hook this up to my Atari ST? I have an old Supra 20Mb hard disk (only one connector on the back, no clock calender). Can I use its SCSI controller to hook up to the CD ROM and the Hard Disk. Any sources of drivers and other software?

4356. Micromix 1

Well, I posted this query a few months ago, but read on..
I am looking for the demo called Micromix 1, which uses samples from M/A/R/R/S
"Pump up the Volume". I am aware that it is on the atari archive, but
unfortunately the version on there is the same screwed up version that I got
from Lord Barak's bbs over a year ago.. So, does anyone have a version of
this demo that has the FULL WORKING SPL FILE.. with out the dropouts and stuff?
This should also serve as a warning not to waste your time grabbing this
program from the archive, since the SPL file is screwed..

>> kermit?
I use Uniterm's kermit between my 1040 and a VAX at 1200 baud.
Uniterm's kermit has always, so far as I know, supported large
packet sizes but VAX kermit implementations have not until recently.

The version currently installed on our VAX (probably NOT the latest
version) is "C-Kermit, 4E(070) 29 Jan 88, Vax/VMS" and it does
support long packets. When I set the Uniterm kermit packet length
to 1024 bytes, I sustain transfer rates slightly in excess of 100CPS
at 1200 baud. This works fine since I rarely experience phone line
errors. Before VAX kermit accepted large packets, I sustained
transfer rates of 75-80CPS.

As a side note, for a while I had a local 9600 baud direct serial
connection between an Atari and a VAX. Even with the old VAX kermit,
I sustained transfer rates which, if memory serves, were in excess of
600CPS. Nice :^). The Atari and Uniterm weren't even breathing hard
so 1600CPS at 19.2kb with large packets wouldn't surprise me. So let
me take this opportunity to say thanks to Simon Poole for a wonderful
program (Uniterm).

Fortunately, this mistake was not repeated with "flex" the lex clone.
According to the COPYING file that comes with flex, the skeleton
source code is fully public domain and any programs generated by flex
are not restricted by copyleft. Personally, I think flex is
wonderful.

From: tas@sequent.UUCP
Message-ID: <49445@sequent.UUCP>
Source record: 236228

Hi folks!

I was wondering if anyone knew where I could get either the Notator
or Creator software for an Atari 1040ST. As I am not at all familiar
with either, does anyone know what these packages are going for
these days?

Or, would anyone happen to know where I could get a used copy of
either?

Any leads would be greatly appreciated!

Thanks,
Theresa

4361. What is Latest Version of "M" now sold by Dr. T's for ST?

All this just support the " Toothless Byte " thread that was running a while back. When a magazine goes from being a source of information which might inform it's readers about things of interest to them, to a bunch of accountants determining " what's in it for us? " then the magazine may as well just become a rehasher of companies press releases.
Then the same thinking becomes " We better not give xxx companies product a bad review, as they have a big ad account with us. " At that point the magazine becomes pretty useless to the readership they once served. BYTE used to be a magazine for all sorts of small systems, now they're just another PC World.

Good luck with the BMS unit and I hope it works for you, but you will
note the person who said he had on working on a BMS didn't say how old
it was or what ROM revision. ICD's latest board has the full SCSI spec
if that is in fact the problem, and their software is excellant. It's
too bad the person on the phone was such a jerk as the people they have
doing online support on GEnie are fairly reasonable and in formative.

The software emulator that I've got are all jokes. I have an Amiga 1000
and a 1040ST. The Amiga Emulator was neat, it reminded me of AmigaDOS 1.1.
A lot of windows did things the Amiga *used* to do, and it even Gurus. But,
like I said, its a joke; a farce.

The ST emulator that I have is poor. It puts up a low-rez default desktop
picture, green/white/black colors, ya know? The mouse pointer turns into
the Atari pointer, but other than that, it doesn't even do anything funny.
It is a big dissappointment.

Now, if anyone has a *real* emulator, or a better joke ST emulator, let me
know....

BTW, has anybody used RezRender? If you do, go to the dialog where you can
define the colors and materials, and click in the box marked "green."
I couldn't stop laughing!

From p.109 of the Feb 1991 (!) issue of Amigaworld:

brainSTorm
The MAST Atari emulator

Runs approx 98% of ST s/w, including MIDI support. Only programs
which should have problems are those doing direct DMA or
programming the MFP.
Supports all ST resolutions incl. color, 8 meg fast & 2 meg CHIP
RAM (Amiga side, not really related to Atari side)
Full page monitor emulation w/scrolling (by this I assume it's
talking about the Moniterm monitor, for which an Amiga version
is also available).
Uses amiga par & ser ports & all floppy drives (no mention of HD
support)
Two ST's at same time on Amiga
"Almost ST speed, text is 120% faster, disk 108%"
sockets for ST ROMS, hw emulation of Atari custom chips

The above is paraphrased from MAST's ad. Cost is $99. No mention of whether it will work on accelerated Amigas, no mention of HD support. MAST has been around for a while, but their products, from my observations, have a mediocre reputation, and their record for getting products out on time is terrible (Their Infinity Machine is second only to the Video Toaster (which BTW, is finally shipping, & is incredible!) in the "Biggest Amiga Vaporware of the decade" category).

In Germany there are supposedly several ST emulators. This is apparently based on one of them.

Flex is not cvered by the GNU copyleft because it was not written for the GNU project. It was out in the public domain long before the copyleft existed. It's distributed with the rest of the GNU stuff because it's Fast and Free and the FSF didn't feel like re-inventing the lex-wheel when flex was such a fine job.

4370. Predictions

Newsgroup: comp.sys.atari.st
Date: 1990-12-30 17:35:45 UTC
From: jimomura@lsuc.on.ca
Message-ID: <1990Dec30.173545.7384@lsuc.on.ca>
Source record: 236240

As far as I can remember, I don't think I've ever posted a "New Year's Message" beyond saying "Happy New Year!" before on any system. So this is probably an all-time-first for me. I have however, though on very rare occasion, made public predictions. I generally do this in cases where the prediction is significant because it "flies in the face" of the opinions of the masses, yet I'm fairly convinced that they are highly probable. Ie, in cases where I'm fairly sure that I'm right and almost everybody else is wrong. An example was my prediction, a few years ago taht Communism would collapse "soon" (it happened sooner than I'd have expected, but I never had sufficient "insider" information to go beyond that). Also, before Nintendo proved me right I said that games on large capacity cartridges were a viable way to make money even in North America (not hard for me to predict since the 1, 2 and 4 Megabit cartriges came out for MSX in 1986 -- before Nintendo had established themselves in North America).

So what am I going to predict? Well, as you can see by my above predictions, they may be startling to "most people", but in fact they were actually fairly conservative, and this one is going to be conservative too:

I think the coming 2 years will prove that the STE and the Lynx were, if not "wonderful" moves, good enough. The STE in particular was a mixed product for me. I wanted an improved ST and the STE sort of parallelled my thinking. It's not the computer I'd have designed. There are many things I can point to, but the most glaring is the 2 new joystick ports. I wouldn't have done that. I'd have put my money into completing the implimentations of the current IO (read/write Centronics, mouse support of the B joystick port, adding the buss out from the Stacey to the 1040ST package, true SCSI) and added a 2nd MIDI out or an STMPE connection. In short, I'd have aimed, ostensibly, at serious applications rather than games. But having mulled over the new spec, I'm satisfied that there are enough improvements "for now" to support significantly better applications than those currently on the market, and that's the key to its viability. Significantly better programs will be brought out over the next 2 years making use of these improvements. People who buy the STEs will, in general, be glad that they did.

Likewise, I think more than just the fact that the Lynx is "a really nice game machine", Atari was right in focussing their marketting on it and giving it an early *heavy* push. The Sega Game Gear is out. I can buy one if I want one *right now*!

Same with the NEC Turbo Express. Atari has cut a niche for themselves
and the future for the Lynx as a development target is good!
Let me put this prediction in perspective a bit more -- I'm likely
to be writing a game myself in the near future and I will probaably
not write a version for the Lynx -- so I'm not saying this with
any current expectation that promoting the Lynx will do me any good
at all. And quite to the contrary, may hurt the sales of the game
I have in mind because I'll be supporting a competitor. Again,
people who by the Lynx, and programmers who develop for the Lynx,
will be glad they did.

So there are my predictions for the coming year, and in fact
2 years. They are typically mine in that they are so extremely
conserative, yet among the things I've read from the Atari community,
and the general computer community, they are not popularly held.
Come back next year (and in 2 years really) and see if I'm right!

PS: Eat your own flames! Do NOT respond to this message! DO post
your own predictions and reasons separately -- I enjoy
quoting people back their pronouncements when time proves
they needed better glasses. :-)

4374. Frame Maker on Spectre

Newsgroup: comp.sys.atari.st
Date: 1990-12-31 06:14:15 UTC
From: daryl@cbnewsc.ATT.COM
Message-ID: <DARYL.90Dec31011415@cbnewsc.ATT.COM>
Source record: 236244

I purchased Frame Maker (Frame Technology) for the MAC and installed it using my Spectre GCR emulator.

This tool works quite well. Everything seems to work. It is (of course) somewhat sluggish on an 8MHZ 68000, but it tolerable. I have seen it on a MAC cx with a large (1Kx1K) monitor and it really works nicely. In fact, I am impressed with how favorably it compares to our SparcStation Is at work given the supposed speed of the SUN Sparcs.

In fact, one thing I noticed comparing Frame to WP in Microsoft Works is that Frame performance is uniform across file sizes (up to 100K in my tests) while WP shows significant performance degradation at 25K file size and up.

Files are supposedly compatible across MAC(ATARI) and Suns, etc. I cannot verify that but others have.

Sorry, I have never used Calamus and cannot compare it to Frame.

4375. Atari 1040ST color system for sale

Newsgroup: comp.sys.atari.st
Date: 1990-12-31 10:32:38 UTC
From: uuvvuu@mixcom.UUCP
Message-ID: <152@mixcom.UUCP>
Source record: 236247
Cross-posted to: misc.forsale.computers,comp.sys.atari.st,wi.forsale

Atari 1040 ST "color system" for sale. This includes the color monitor, a Supra 2400 external modem, 100+ disks of software, and of course all cabling and manuals. Price is a "negotiable" $700.00, and that includes shipping. Would also be interested in trading for PC hardware.

If interested, contact David Kelsey @ 414/643-4868 (answering machine, call anytime)... DO NOT CONTACT ME. I am posting this for him.

Thanks.

4376. OPUS Starter Pack?

Newsgroup: comp.sys.atari.st
Date: 1990-12-31 10:50:30 UTC
From: svrobins@npe.isnet.inmos.co.uk
Message-ID: <147.277f17f7@npe.isnet.inmos.co.uk>
Source record: 236245

I (like many others judging by the number of recent postings) am unable to get OPUS to "chart". I have at least two versions of GDOS, but very few fonts. Perhaps some kind soul could post a tried-and-tested "OPUS Charting Starter Pack" eg.

. a minimal set of GDOS PD screen fonts and PD epson printer fonts.
. an ASSIGN.SYS file which *REALLY WORKS* and that OPUS will accept.
. instructions ?
. anything else that may be necessary ?

This would of course have to be rock-solid/easy-to-use/just-add-GDOS, or we will just end up with lots more postings on "How do I use the Starter Pack?".

Anyone care to oblige?

Thanks in advance,

Paul Robins.

4377. eprom cartridge

Newsgroup: comp.sys.atari.st
Date: 1990-12-31 11:10:46 UTC
From: meijer@nvpna1.prl.philips.nl
Message-ID: <meijer.662641846@nvpna1>
Source record: 236246

I just build a eprom cartridge for my ST but i have some
problems now. I would like to put a few programs there
(gulam, pinhead etc) i know this should be possible.
But how do i make the file which should be placed in
the four roms? My epromburner (DELA) can't do this for me,
so my question is how do i put these files in one big
file, or has someone a program which does this?
Thank you for reading this.

Sounds pretty interesting. There has been lots of discussion on ST
emulators on Fidonet and on of the local Austin boards. I've seen a
couple of the software-only ones. One of them actually worked to some
degree. Got Chessmaster running on it in both low and high res.
I've heard of one that sounds very similar to the one you posted about, I
have to wonder if its not the same one. But the price was 195$, which
seems a little more realistic, and it would only work on a 2000 or 3000,
not a 500. Did the AmigaWorld article say which models it worked on?
You say the article stated that text speed was 120% of an ST and disk I/O
108% of an ST. I would be curious to know how the numbers would compare
if you used one of the inexpensive 'software blitters' like Quick ST or
Turbo ST and used disks with a 'twisted' sector skew in the tests. Many,
if not most ST users do these things and thus increase their performance
greatly without spending much. I'd be curious whether you could do this
on the emulator and how it would compare to an ST then. Also, the
software emulator I saw working worked at a decent speed when in high-res
monochrome mode (flicker often got pretty bad though). But, in medium

and low res modes, the speed was significantly slower - not anywhere near what the high-res was. I guess that was it having to keep up with the color planes. I'm not saying that the others are this way to, it just makes me wonder. In Germany it wouldn't matter so much, as the migh-res monochrome mode is the most popular way to set up STs there, and most of the software will run in that resolution.
You said that there were several ST emulators in Germany and this was based on one of them. Perhaps its not the same one I read about then, but I had only read about one confirmed ST emulator in Germany. It had been demonstrated at a computer show over there. Of course, I could have easily missed the others, I don't subscribe to German computer mags....

The following opinions are my own and not those of anyone else who might be registered on fquest.fidonet.org. All flames can be sent to alt.flames since we don't read that here.

Well, I have not seen it yet, but there is a hardware ST emulator
board for the Amiga called the Medusa Board. I'm not sure what
the compatibility is like. Also, I have yet to see a working
software emulation for the ST on the Amiga. I suspect it isn't
very easy to do in software since there are so many custom chips
in the ST to emulate.

>
> ....Yonderboy@cup.portal.com

Have a happy one.

Cheers,

Chris

I have a Spectre 128 for the Atari ST for sale. It provides emulation of a Mac Plus on the ST using either the 64k or 128k mac roms. I've upgraded to the GCR. Please respond via email. I'll be out of town until 1/6, so don't be suprised if I don't get back with you immediately. If you leave your phone number, I'll call you back. Asking price is $75.

4383. Deskjet 500 underline problem found.

Newsgroup: comp.sys.atari.st
Date: 1990-12-31 20:44:30 UTC
From: pegram@kira.UUCP
Message-ID: <1990Dec31.204430.5442@uvm.edu>
Source record: 236156
Cross-posted to: comp.periphs.printers,comp.sys.atari.st

A few weeks ago, I wrote in c.p.printers about a problem I was having with underlining on an HP DeskJet 500. It turns out that the problem with underlines showing up in the middle of the succeeding line was due to a "feature" of my word processor's printer driver, and to my handling of sub and superscript text.

On the Hp, subscript and superscript text is moved up and down on the page, but the font size is not made smaller automatically (as it is on Epson compatibles). WordWriter ST sends out an init string to the printer before each print out - whether you specified one of your own or not - consisting of all the codes to "turn off" all the print attributes that the current printer driver knows about. My driver somehow ended up with all my text printed superscript (I think it was trying to turn off subscript - or I got those codes backwards, if so, BLUSH 8-), thus the underlines were all 1/2 line too low.

My thanks to all those who responded to my pleas for help and I hope that someone else can learn from my tale 8-).

Well here is a stab in the dark for you. I have 2 cdar504's on my bbs
they are the ATari cd_roms. they have a chinon engine in them with a
Chinion "ASCI" -"Atari Small Computer Interface" adaptor in them.

My guess is yes you could them to work. Atari has released to its developers
and with its sales of the cdar504's a program called MetaDos. I am sorry
to say Meta_dos is not Public Domain so I can not post it to the net
for you. My guess is you would have to hack the BIOS driver to suit
your cd_rom as well.

Contact your local Atari rep or company and ask if you obtain a copy
of Meta_dos.

You should be able to use your "Supra" interface / ICD interface to
drive it.

Let me know how you get on.

Jon Clarke.

4385. Gnu Chess (and MGR) ???

Newsgroup: comp.sys.atari.st
Date: 1990-12-31 21:57:14 UTC
From: david@doe.utoronto.ca
Message-ID: <1990Dec31.215714.28374@doe.utoronto.ca>
Source record: 236157

1) Would some kind soul please compile gnu chess and send the binaries
to atari.archive? I have tried, but gnu chess has some monster functions,
and my mega 2 runs out of memory even with the optimisation turned off.
__PLEASE__ use Eric Smith's MiNT library and GCC to compile if possible.
The fancy curses-based version would be the best thing, probably. I
know that Eric Smith did a port a couple of years back, but I cannot
even get it to run under MiNT and Gulam (not to mention mgr).

2) If anyone is daring and really likes MGR, you could try porting the
Sunview/X-Windows version of Gnu chess, including icons and (I presume)
mouse support. Wouldn't that be nice to run under MGR??

Thanks,

David

Re the Amiga/ ST emulator,

Well Chris I for one was shocked with the quality of the software emulator
called "ST-HACK". It appears this was done in DL/Germany and will run
in low - medium and high res. Though in high res the interlacing on
the Amiga is awful.

It ran most of the software we have here and QuickST and turboST did
indeed help speed up the desktop. The speed is akin to running a mono_emulatoe
(make that mono_emulator) on a colour ST.

So I was very impressed with Amiga/ST emulator. Although remember the
OS they use which is TOS version 1.2 is pirated and therefore illegal.
